3.625 Million cell updates/sec

Title: nm000201

Perfect score: 2986

Sequence: 1 GCGCCCGAGTCGAGCTGAG.....ATAAAGTTTCTCAACTGCC 2986

Scoring table: IDENTITY NUC

Gapop 10.0 , Gapext 0.5

Searched: 2288 seqs, 46127 residues

Total number of hits satisfying chosen parameters: 4576

Minimum DB seq length: 18

Maximum DB seq length: 26

Post-processing: Minimum Match 0%

Maximum Match 100%

Listing first 2293 summaries

Database : rng201.seq.*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

Result No.	Score	Query Match %	Length	ID	Description
C 1	26	0.9	26	1	Human intercellula
C 2	26	0.9	26	1	Intercellular adhe
C 3	26	0.9	26	1	Low adenosine anti

PT Treatment of airway diseases such as asthma - by topically applying
adenosine-free antisense oligo:nucleotide to airway epithelium of
subject.

XX
PS Claim 5; Page 28; 7lpp; English.

CC A method for treating airway disease in a subject has been produced,
CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide HSCAM1AS7
CC specific for the human intercellular adhesion molecule-1 (ICAM-1). The
CC method can be used to treat airway diseases such as cystic fibrosis,
CC asthma, chronic obstructive pulmonary disease, bronchitis and other
CC airway diseases characterised by an inflammatory response. By eliminating
CC adenosine from the antisense ON, its liberation upon antisense
CC degradation is prevented, thereby preventing adenosine- induced
CC bronchoconstriction in patients with hyper-reactive airways

PT New antisense oligonucleotides used in treatment of, e.g. pulmonary
vasoconstriction.

XX
PS Disclosure; Page 47; 120pp; English.

CC The specification describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-
CC -end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AAX5272-74. These multiple target oligonucleotides
CC (specifically AAX55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC well as all types of cancers which may metastasize or have metastasized
CC to the lungs, including breast and prostate cancer

 XX PT New antisense oligonucleotides useful for treating e.g. pulmonary
 PT vasoconstriction, inflammation, allergies, asthma, hypertension,
 PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
 PT cancers.
 XX
 XX PS Claim 18; Page 400; 1343pp; English.
 XX
 XX CC The present invention describes a new composition comprising an antisense
 CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
 CC nucleic acids involved in bronchoconstriction, allergies, and/or
 CC inflammation. The ON can have antiinflammatory, antiallergic,
 CC antiasthmatic, cycostatic and analgesic activities. The compositions are
 CC useful for the treatment of diseases associated with inflammation,
 CC impaired airways, including lung disease and diseases whose secondary
 CC effects afflict the lungs of a subject. They can be used for treating
 CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
 CC impaired respiration, respiratory distress syndrome, pain, cystic
 CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
 CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
 CC carcinomas, and cancers which may metastasize to the lungs, including
 CC breast and prostate cancer. The reduction of the adenosine content of the
 CC ONs reduces side effects. The A-containing ONs break down with the
 CC release of deoxyadenosine which activates adenosine receptors causing
 CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
 CC nucleotide sequences given in the sequence listing from the present
 CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
 CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
 CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
 CC AAA33992) are specifically claimed ONs from the present invention. N.B.
 CC Sequences given in the disclosure of the present invention do not match
 CC up with their corresponding SEQ ID NO: sequences given in the sequence
 CC listing

 XX PT Low adenosine (A) content antisense oligonucleotides which do not trigger
 PT adenosine receptors during metabolism, useful e.g. for treating cancers
 and respiratory obstructions.
 XX
 XX PS Claim 14; Page 145; 1592pp; English.
 XX
 XX CC The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction
 CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
 CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
 CC fragments and antisense oligonucleotides used in the exemplification of
 CC the present invention

 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
 PT ubiqunone.
 XX
 PS Disclosure; SEQ ID NO 10447; 872pp; English.
 XX
 CC The invention relates to a novel pharmaceutical composition, which has a
 CC first active agent comprising an oligonucleotide antisense to the
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
 CC junctions of genes encoding a polypeptide associated with lung and/or
 CC nasal airway dysfunction and a second active agent comprising an
 CC antiinflammatory steroid and ubiqunone. A composition of the invention
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
 CC immunosuppressive, and cytotatic activity. The composition may have a
 CC use in antisense gene therapy. The composition is useful for treating or
 CC preventing a respiratory, lung or malignant disease or condition, also
 CC for enhancing the prophylactic or therapeutic respiratory effect of an
 CC antiinflammatory steroid in a subject, for reducing or depleting levels
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
 CC receptor, producing bronchodilation, increasing levels of ubiqunone or
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
 CC lung inflammation, lung allergies, or a respiratory disease or condition.
 CC Note: The sequence data for this patent is not represented in the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/published_pct_sequences

 PT Pharmaceutical composition for treating asthma, has antisense
 PT oligonucleotide containing less percentage of adenosine, targeted to
 PT nucleic acids associated with lung airway or lung dysfunction, and
 PT bronchodilating agent.
 XX
 PS Claim 15; SEQ ID NO 10447; 763pp; English.
 XX
 CC This invention describes a novel composition (a) a first active agent,
 CC comprising oligonucleotides, effective for alleviating
 CC bronchoconstriction, respiratory tract inflammation, allergies and
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
 CC surfactant depletion or hyposecretion, when administered to a mammal. The
 CC oligonucleotides are derived from a gene encoding or regulating
 CC expression of a target polypeptide associated with lung airway or lung
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
 CC The invention also describes a kit, that comprises: (a) a delivery
 CC device, in separate containers, (b) the oligonucleotides, (c)
 CC instructions for adding a carrier and for use of the kit. The composition
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic, is a
 CC beta-adrenergic agonist. The composition is useful for preventing or
 CC treating a respiratory, lung or malignant disease. The administered
 CC composition comprises oligo and is administered to reduce the production
 CC or availability, or to increase the degradation of the target mRNA or to
 CC reduce the amount of target polypeptide present in the lungs. The
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung
 CC inflammation, allergies and/or surfactant hypoproduction are associated
 CC with a disease or condition such as pulmonary vasoconstriction,
 CC inflammation, allergies, asthma, impeded respiration, respiratory
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary

CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.
 CC The reduced adenosine content of the anti-sense oligos corresponding to
 CC thymidines present in the target RNA serves to prevent the breakdown of
 CC the oligonucleotides into products that free adenosine into the system
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
 CC prevent any unwanted effects due to it

 PT Treatment of airway diseases such as asthma - by topically applying
 PT adenosine-free antisense oligo:nucleotide to airway epithelium of
 PT subject.
 XX
 PS Claim 5; Page 28; 71pp; English.
 XX
 CC A method for treating airway disease in a subject has been produced,
 CC which involves the topical administration of an essentially adenosine
 CC free antisense oligonucleotide (ON) to the airway epithelium of the
 CC subject. The present sequence is an antisense oligonucleotide HSICAMIAS8
 CC specific for the human intercellular adhesion molecule-1 (CAM-1). The
 CC method can be used to treat airway diseases such as cystic fibrosis,
 CC asthma, chronic obstructive pulmonary disease, bronchitis and other
 CC airway diseases characterised by an inflammatory response. By eliminating
 CC adenosine from the antisense ON, its liberation upon antisense
 CC degradation is prevented, thereby preventing adenosine- induced
 CC bronchoconstriction in patients with hyper-reactive airways

XX      New hybridomas producing monoclonal antibodies specific for intracellular
XX      adhesion molecule 4 - used to e.g. identify ICAM 4 expressing cells, to
XX      assay or purify ICAM 4 and as ICAM 4 modulators.
XX
XX      Example 10; Col 19; 42pp; English.
XX
XX      This primer is complementary to the human intercellular adhesion molecule
XX      polypeptide (ICAM)-1 domain 3 and is used for the cloning of human ICAM-
XX      4. The invention provides hybridomas 127A, 127H and 173E, corresponding
XX      to ATCC numbers HB 11905, 11911 and 11912, respectively, and monoclonal
XX      antibodies (MAb) secreted by them. The MAbs are specific for ICAM-4,
XX      which is expressed almost exclusively in the brain, with low level
XX      expression in the spleen. They are used to characterise binding sites in
XX      ICAM-4, to purify ICAM-4, in immunising compositions for production of
XX      anti-idiotypes, to identify cells that express ICAM-4 on the surface. The

 XX
 PS Example 5; Col 16; 11lpp; English.
 XX
 CC PCR primers AAV54843-44 are used to amplify a 230 bp fragment of ICAM-1
 CC (intercellular adhesion molecule-1) domain 3. The product is used as a
 CC probe to isolate ICAM-R. ICAMs are polypeptides that are expressed on
 CC blood vessel endothelial cell surfaces and are involved in the adhesion
 CC events in various conditions. ICAM-R variants (see AAW71264-69) can be
 CC used to treat or monitor inflammatory conditions involving specific or
 CC non-specific immune responses, asthma, tumour growth and/or metastasis and
 CC viral infections. The ICAM variants are produced recombinantly, from
 CC expression libraries of mutated sequences, and the ones that are claimed
 CC are the ones that have been found to be especially involved in adhesion
 CC events. They can also be used to raise antibodies, also for use as
 CC therapeutic or diagnostic agents. (Updated on 25-MAR-2003 to correct PR
 CC field.)

 CC peptide, can block, inhibit or stimulate ligand/receptor interactions
 CC involving ICAM-R, particularly its effector functions involved in
 CC (non)specific immune responses. ICAM-R related agents may be used to
 CC treat or monitor inflammation, disorders involving T cell activation or
 CC macrophages, e.g. adult respiratory distress syndrome, stroke, Crohn's
 CC disease, multiple sclerosis, rheumatoid arthritis, asthma, tumour growth,
 CC human immune deficiency virus infection, diabetes, graft vs. host disease
 CC and many others. Antibodies may also be used for passive immunisation,
 CC for purifying, detecting or quantifying ICAM-R and for identifying ICAM-R
 CC expressing cells

 PT ICAM-4.
 XX
 XX Example 10; Page 35; 101pp; English.
 PS
 XX This sequence is a PCR primer for a human ICAM-4 coding sequence. The
 CC invention relates to a method of screening for neuropathology in an
 CC individual, comprising quantitating the concentration of circulating
 CC intracellular adhesion molecule-4 (ICAM-4). Anti-ICAM-4 antibodies of the
 CC invention are used to purify ICAM-4, and for the modulation of
 CC ligand/receptor binding activities involving ICAM-4. The methods
 CC can be used to screen for neuropathies, e.g. cerebral ischaemia (i.e.
 CC stroke) resulting from various disorders such as thrombosis, embolism,
 CC cerebral aneurysmal haemorrhage, vasospasm, etc. Quantification of
 CC circulating ICAM-4 can also distinguish between various forms of epilepsy
 CC and may also permit determination of the stage of AIDS progression.
 CC Quantification of circulating ICAM-4 can also be useful for diagnosis for
 CC Alzheimer's disease, and other cortical dementia such as Pick's disease,
 CC diffuse cortical Lewy body disease, frontal lobe degeneration, as well as
 CC subcortical dementia such as Parkinson's disease, Huntington's disease,
 CC and progressive supranuclear, and a number of primary psychiatric
 CC disorders such as depression, schizophrenia, and psychosis, and
 CC nongenetic dementia arising from infections, vasculitis, metabolic and
 CC nutritional disorders (e.g. thyroid, vitamin B12 deficiency), toxic
 CC encephalopathies (e.g. exposure to carbon monoxide, or heavy metals) and
 CC tumours

XX
XX The specification describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-
CC end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AAX55272-74. These multiple target oligonucleotides
CC (specifically AAX55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC well as all types of cancers which may metastasize or have metastasized
CC to the lungs, including breast and prostate cancer

 XX
 PS Claim 18; Page 400; 1343pp; English.
 XX
 CC The present invention describes a new composition comprising an antisense
 CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
 CC nucleic acids involved in bronchoconstriction, allergies, and/or
 CC inflammation. The ON can have antiinflammatory, antiallergic,
 CC antiasthmatic, cytostatic and analgesic activities. The compositions are
 CC useful for the treatment of diseases associated with inflammation,
 CC impaired airways, including lung disease and diseases whose secondary
 CC effects afflict the lungs of a subject. They can be used for treating

CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
 CC impeded respiration, respiratory distress syndrome, pain, cystic
 CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
 CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
 CC carcinomas, and cancers which may metastasise to the lungs, including
 CC breast and prostate cancer. The reduction of the adenosine content of the
 CC ONS reduces side effects. The A-containing ONS break down with the
 CC release of deoxyadenosine which activates adenosine receptors causing
 CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
 CC nucleotide sequences given in the sequence listing from the present
 CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
 CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
 CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
 CC AAA33992) are specifically claimed ONS from the present invention. N.B.
 CC Sequences given in the disclosure of the present invention do not match
 CC up with their corresponding SEQ ID NO: sequences given in the sequence
 CC listing

XX Identifying modulators of protein kinase C phosphorylation of human
 XX intercellular adhesion molecule polypeptide.

XX Example 5; Col 119-120; 122pp; English.

XX This invention describes a novel method for identifying a compound that
 CC modulates phosphorylation of human intercellular adhesion molecule
 CC polypeptide (ICAM-R) by protein kinase C isoform. The method comprises:

CC (a) exposing a purified peptide consisting of the cytoplasmic domain of
 CC ICAM-R to protein kinase C isoform and labeled adenosine triphosphate in
 CC the presence and absence of a test compound; (b) measuring labeled
 CC phosphate transferred to the peptide; and (c) identifying a test compound
 CC that affects transfer of the labeled phosphate as a modulator compound.
 CC The method is useful for identifying compounds that modulate the
 CC phosphorylation of human intercellular adhesion molecule polypeptide
 CC which might form the basis for the development of therapeutic and
 CC diagnostic agents. This sequence represents a primer used in the method
 CC of the invention

 PT Hybrid fusion proteins comprising intercellular adhesion molecule or its
 PT variants useful, for treating inflammatory conditions, Crohn's disease,
 PT atherosclerosis and diabetes.
 XX
 PS Example 5; Col 16; 109pp; English.
 XX
 CC This invention relates to a hybrid fusion protein comprising an
 CC intercellular adhesion molecule (ICAM-R) amino acid fragment at its amino
 CC terminus and a constant domain of an immunoglobulin heavy chain at its
 CC carboxy terminus. ICAM-R polypeptides are useful for treating and
 CC monitoring inflammatory conditions such as adult respiratory distress
 CC syndrome, multiple organ injury syndrome secondary to septicemia or
 CC trauma, reperfusion injury of tissue, acute glomerulonephritis, reactive
 CC arthritis, dermatosis, stroke, thermal injury, haemodialysis,
 CC leukapheresis, ulcerative colitis, Crohn's disease, necrotising
 CC enterocolitis, granulocyte transfusion associated syndrome,
 CC atherosclerosis and cytokine induced toxicity. ICAM-R polypeptides are
 CC also useful for treating conditions resulting from a response of the
 CC specific immune system in a mammal e.g. psoriasis, organ/tissue

CC transplant rejection and autoimmune diseases including Raynaud's
 CC syndrome, autoimmune thyroiditis, multiple sclerosis, rheumatoid
 CC arthritis, diabetes and lupus erythematosus. ICAM-R products and ICAM-R
 CC related products are also useful in monitoring and treating asthma,
 CC tumour growth and/or metastasis, and viral infection (e.g. HIV
 CC infection). Sequences AAA97090 and AAB13036 represent the human ICAM-R
 CC DNA and protein sequences. Sequences AAA97091-A97112 represent ICAM-R DNA
 CC fragments, PCR primers and probes, all used in the identification of the
 CC ICAM-R DNA sequence. AAA97113-A97123 and AAA97129-A97152 represent
 CC primers used in the production of humanised anti-ICAM-R antibody ICR-8.1,
 CC and fragments of the humanised antibody. Sequences AAA97124-A97128,
 CC AAA97132, AAA97144 represent ICR-8.1 sequences. Sequences AAA97153-A97176
 CC excluding AAA97155-A97156 represent primers used in the production of

 CC immunosuppressive, antipsoriatic, antiasthmatic, antitussive activity and
 CC can be used for antisense therapy; gene therapy. The antisense nucleic
 CC acids or vectors are used to inhibit or eliminate acute or chronic
 CC inflammatory diseases of humans, virus infection, metastasis,
 CC inflammation of the skin, mobilization of hematopoietic stem cells,
 CC coughs and all biological processes under the influence of ICAM-1,
 CC ulcerative colitis, rheumatoid arthritis, lupus erythematosus, organ
 CC rejection, graft-versus-host reaction after bone marrow transplantation,
 CC psoriasis, asthma and neurodermatitis. In particular, the antisense
 CC nucleic acids are used to treat acute or chronic inflammation of gum
 CC disease. The antisense nucleic acids regulate or suppress ICAM-1 gene
 CC expression. The antisense nucleic acids or vectors can be used to
 CC suppress immune reactions against gene therapy using viral or non-viral
 CC vectors in mammals. The antisense nucleic acids may also be used in kits
 CC to diagnose ICAM-1 associated disturbances. AAA12093-Al2098 represent
 CC fragments of human ICAM-1 DNA which is used in the method of the
 CC invention

XX DR Low adenosine (A) content antisense oligonucleotides which do not trigger

XX PT adenosine receptors during metabolism, useful e.g. for treating cancers

XX PT and respiratory obstructions.

XX PS Claim 14; Page 145; 1592pp; English.

XX CC The present invention describes low adenosine (A) content antisense

XX CC oligonucleotides and compositions (I) comprising them. In the antisense

XX CC oligonucleotides the A is replaced by a 'Universal' or alternative base.

XX CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,

XX CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.

XX CC The antisense oligonucleotides and (I) can be used to down-regulate the

XX CC expression and or activity of target polypeptides associated with

XX CC lung/respiratory disorders and malignancies, such as stimulating and

XX CC activating peptide factors and transmitters, transcription factors,

XX CC immunoglobulins and antibodies, antibody receptors, cytokines and

XX CC chemokines, endogenously produced specific and non-specific enzymes,

XX CC binding proteins, adhesion molecules and their receptors, cytokine and

XX CC chemokine receptors, adenosine receptors, bradykinin receptors, central

XX CC nervous system (CNS) and peripheral nervous and non-nervous system

XX CC receptors, CNS and peripheral nervous and non-nervous system peptide

XX CC transmitters, defensins, growth factors, vasoactive peptides and

XX CC receptors, binding proteins and malignancy associated proteins. The

XX CC antisense oligonucleotides may be used in this way to treat disorders

XX CC including respiratory obstruction (especially pulmonary obstruction

XX CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or

XX CC surfactant hypoproduction which are associated with a disease or

XX CC condition selected from pulmonary vasoconstriction, inflammation,

XX CC allergies, asthma, impeded respiration, respiratory distress syndrome

XX CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary

XX CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),

XX CC pulmonary transplantation rejection, pulmonary infections, bronchitis,

XX CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide

XX CC fragments and antisense oligonucleotides used in the exemplification of

XX CC the present invention

 PT Producing sub-population of labeled nucleic acids, useful for analyzing
 PT differences in RNA profiles between several different physiological
 PT sources, using set of distinct gene specific primers.
 XX
 XX Example 3; SEQ ID NO 527; 11pp; English.
 PS
 XX The invention relates to producing a sub-population of labeled nucleic
 CC acids (NAs) comprising contacting a NA sample from a physiological
 CC source, with a pool of 50 distinct gene specific primers under suitable
 CC conditions to enzymatically generate sub-population of NAs, where each
 CC gene specific primer has a sequence complementary to a distinct mRNA, and
 CC each labeled NA is generated using a single gene specific primer. The
 CC method is useful for producing a sub-population of labeled NAs which is
 CC useful for analysing the differences in the RNA profiles between several
 CC different physiological sources, where the method comprises producing
 CC subpopulation of labeled NAs for the different physiological sources,
 CC comprising the populations for each physiological source to identify
 CC differences in the population, where the comparison is preferably
 CC performed by hybridising the labeled NAs for each of the distinct
 CC physiological sources to an array of probe NAs stably associated with the
 CC surface of a substrate to produce a hybridisation pattern for each of the
 CC sources, and comparing the patterns for each of the sources, where
 CC differential gene expression assays are utilised in differential
 CC expression analysis of diseased a normal tissue e.g. neoplastic a normal
 CC tissue, or different tissue or subtype types. The present sequence is a
 CC human gene specific PCR primer used in the method of the invention. Note:

CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from USPTO
 CC at http.wipo.segdata.uspto.gov/sequence.html?DocID=635282981

XX New cells recombinantly altered to express an exogenous AK155 cytokine
 PT receptor, useful for identifying agents for treating AK155-mediated
 PT diseases, e.g. inflammation, angiogenesis or cancer.
 XX Example 2; Page 51; 100pp; English.
 XX The present invention relates to a cell recombinantly altered to express
 CC an exogenous AK155 cytokine receptor comprising alpha and beta subunits.
 CC The cytokine receptor, when expressed in Ba/F3 cells, binds to AK155 and
 CC stimulates binding of STAT3 to interferon (IFN) gamma-activated
 CC sequences. The cell is useful in expressing AK155 cytokine receptor which
 CC may be used for identifying therapeutic agents useful for treating AK155-
 CC mediated conditions or diseases, such as inflammation (e.g. Crohn's
 CC disease), autoimmune diseases (e.g. multiple sclerosis, rheumatoid
 CC arthritis, psoriasis, asthma, allergies, diabetes mellitus, Sjogren's
 CC syndrome), transplant rejection, angiogenesis, and cancer. The current
 CC sequence represents an ICAM-1 probe sequence

XX Hybridoma cell line for production of monoclonal antibodies useful for
 PT treating e.g. asthma and arthritis.

XX Example 5; SEQ ID NO 23; 127pp; English.

XX The invention relates to a hybridoma cell line ATCC HB 12190 producing a
 CC monoclonal antibody against human intercellular adhesion molecule
 CC polypeptide (ICAM-R). Also included are a monoclonal antibody produced by
 CC the hybridoma cell line, identification of a compound that modulates the
 CC interaction of binding partners intercellular adhesion molecule
 CC polypeptide (ICAM-R) and CD11b (involving: immobilising ICAM-R or CD11b,
 CC detectably labelling the non-immobilised binding partner, contacting the
 CC immobilised binding partner with the labelled binding partner in the
 CC presence and absence of test compound, detecting the label bound to the
 CC immobilised binding partner and identifying a modulating compound as a
 CC test compound that affects the label bound in the presence of the test
 CC compound in comparison to the label bound in the absence of the test
 CC compound) and identification of a compound that modulates phosphorylation
 CC of ICAM-R by protein kinase C isoform (involving: exposing ICAM-R peptide

comprising amino acids 482-518 of ADG25651 to protein kinase C isoform
 CC and labelled phosphate in the presence and absence of a test compound,
 CC measuring labelled phosphate transferred to the ICAM-R peptide and
 CC identifying a test compound that affects transfer of the labelled
 CC phosphate as a modulator compound). The hybridoma cell line ATCC HB 12190
 CC is useful in the production of monoclonal antibodies useful for
 CC identifying compounds and for the treatment of conditions resulting from
 CC a response of the nonspecific immune system in a mammal (e.g. adult
 CC respiratory distress syndrome, multiple organ injury syndrome secondary
 CC to septicemia, multiple organ injury syndrome secondary to trauma,
 CC reperfusion injury of tissue, acute glomerulonephritis, reactive
 CC arthritis, dermatosis with acute inflammatory components, stroke, thermal
 CC injury, haemodialysis, leukapheresis, ulcerative colitis, Crohn's
 CC disease, necrotising enterocolitis, granulocyte transfusion associated
 CC syndrome, atherosclerosis and cytokine-induced toxicity) and conditions
 CC resulting from a response of the specific immune system in a mammal (e.g.
 CC psoriasis, organ/tissue transplant rejection and autoimmune diseases
 CC including Raynaud's syndrome, autoimmune thyroiditis, experimental
 CC autoimmune encephalomyelitis (EAE), multiple sclerosis, rheumatoid
 CC arthritis, diabetes or lupus erythematosus), asthma, tumour growth and/or
 CC metastasis and viral infection (e.g. HIV infection). The monoclonal
 CC antibodies are readily available using immunogens comprising cells
 CC naturally expressing intercellular adhesion molecule polypeptide (ICAM-R)
 CC or its variants and display ligand/receptor binding biological activities
 CC and/or immunological properties specific to ICAM-R. The present sequence
 CC is a primer or probe used in the isolation of nucleic acids encoding
 CC human ICAM-R.

XX DR
XX Pharmaceutical composition for treating asthma, has antisense
XX oligonucleotide containing less percentage of adenosine, targeted to
XX nucleic acids associated with lung airway or lung dysfunction, and
XX bronchodilating agent.
XX PS
XX Claim 15; SEQ ID NO 10448; 763pp; English.
XX CC
XX This invention describes a novel composition (a) a first active agent,
XX comprising oligonucleotides, effective for alleviating
XX bronchoconstriction, respiratory tract inflammation, allergies and
XX reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
XX surfactant depletion or hyposcretion, when administered to a mammal. The
XX oligonucleotides are derived from a gene encoding or regulating
XX expression of a target polypeptide associated with lung airway or lung
XX dysfunction or cancer and can be anti-sense to the corresponding mRNA.
XX The invention also describes a kit, that comprises: (a) a delivery
XX device, in separate containers, (b) the oligonucleotides, (c)
XX instructions for adding a carrier and for use of the kit. The composition
XX of the invention has antiallergic, antiinflammatory, antiasthmatic,
XX analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
XX beta-adrenergic agonist. The composition is useful for preventing or
XX treating a respiratory, lung or malignant disease. The administered
XX composition comprises oligo and is administered to reduce the production
XX or availability, or to increase the degradation of the target mRNA or to
XX reduce the amount of target polypeptide present in the lungs. The
XX pulmonary obstruction, and/or bronchoconstriction and/or lung
XX inflammation, allergies and/or surfactant hypoproduction are associated
XX with a disease or condition such as pulmonary vasoconstriction,
XX inflammation, allergies, asthma, impeded respiration, respiratory
XX distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
XX hypertension, emphysema, chronic obstructive pulmonary disease, cancer.
XX transplantation rejection, pulmonary infections, bronchitis or cancer.
XX The reduced adenosine content of the anti-sense oligos corresponding to
XX thymidines present in the target RNA serves to prevent the breakdown of
XX the oligonucleotides into products that free adenosine into the system
XX e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

 PT Pharmaceutical composition comprising a virus bound to a functional
 PT derivative of intercellular adhesion molecule-1, useful as vaccine for
 PT preventing viral infection, preferably rhinoviral infection in a subject.
 XX
 PS Example 2; Col 20; 37pp; English.
 XX
 CC The present invention describes a pharmaceutical composition (I)
 CC comprising a virus bound to a functional derivative of intercellular
 CC adhesion molecule-1 (ICAM)-1 in a mixture with a pharmaceutically
 CC acceptable carrier, where the functional derivative comprises amino acids
 CC 1-451 of the ICAM-1 amino acid sequence (S1) given in ABP53764, having
 CC homologous domains, followed by a phenylalanine (F). Optionally, (I)
 CC comprises a virus bound to a functional derivative of ICAM-1 in a mixture
 CC with a carrier, where the functional derivative contains an amino acid
 CC substitution chosen from S3/T, K8/E, R13/K, G15/SA, Y52/F, S61/I,
 CC Q62PW/API, M64/I, Y66/T, N68/K, D71/E, S74/A, T75/A, R88V/EA, E90/Q,
 CC L91/A, N118/Q, R125/E, E127/R, K 128/R, V136GE/GVK, N156/E, A178/G,
 CC A189T/SI, D203TQ/TAD and Y452E/F. (I) has virucide activity and can be
 CC used in vaccines. (I) is useful for preventing viral infection in an
 CC individual, preferably rhinoviral infection. The present sequence
 CC represents a mutagenic oligonucleotide for ICAM-1, which is used in an
 CC example from the present invention

 CC Diagnosing presence of viral infection, by contacting suspected
 CC biological sample with labeled soluble intercellular adhesion molecule-1
 CC functional derivative, and determining presence of complexes of
 CC functional derivative and virus.
 XX
 PS Example 2; Col 20; 37pp; English.
 XX
 CC This invention describes a novel method of diagnosing the presence of
 CC viral infection (especially caused by major serotype rhinovirus). The
 CC method involves contacting a biological sample suspected of containing a
 CC virus with a detectably labelled and soluble intercellular adhesion
 CC molecule (ICAM)-1 functional derivative which forms detectable complexes
 CC of ICAM-1 functional derivative and virus. The soluble functional
 CC derivative of ICAM-1 lacks a transmembrane domain and comprises domains
 CC -2 of ICAM-1, or a variant of domains 1-2 of ICAM-1. The method can be
 CC used for treating viral infection in an individual in need of treatment
 CC by using a functional derivative of ICAM-1, an anti-idiotypic antibody to
 CC anti-ICAM antibody, or antibody to ICAM-1 for antiviral therapy. The
 CC method enables identification of the serotype (or subspecies) of the
 CC virus. This sequence represents a mutagenic primer which introduces the
 CC Y4476TAG mutation which results in a truncated ICAM-1 (Dcyt-).

CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide HSCAM1AS4
CC specific for the human intercellular adhesion molecule-1 (CAM-1). The
CC method can be used to treat airway diseases such as cystic fibrosis,
CC asthma, chronic obstructive pulmonary disease, bronchitis and other
CC airway diseases characterised by an inflammatory response. By eliminating
CC adenosine from the antisense ON, its liberation upon antisense
CC degradation is prevented, thereby preventing adenosine- induced
CC bronchoconstriction in patients with hyper-reactive airways

XX
XX New antisense oligonucleotides useful for treating e.g. pulmonary
PT vasoconstriction, inflammation, allergies, asthma, hypertension,
PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
XX Claim 18; Page 400; 1343pp; English.
XX
XX The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cyostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impaired respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukemias, lymphomas,
CC carcinomas, and cancers which may metastasize to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.

XX Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
XX Disclosure; SEQ ID NO 10446; 872pp; English.
XX
XX The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

 This invention describes a novel composition (a) a first active agent,
 comprising oligonucleotides, effective for alleviating
 bronchoconstriction, respiratory tract inflammation, allergies and
 reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
 surfactant depletion or hyposcretion, when administered to a mammal. The
 oligonucleotides are derived from a gene encoding or regulating
 expression of a target polypeptide associated with lung airway or lung
 dysfunction or cancer and can be anti-sense to the corresponding mRNA.
 The invention also describes a kit, that comprises: (a) a delivery
 device, in separate containers, (b) the oligonucleotides, (c)
 instructions for adding a carrier and for use of the kit. The composition
 of the invention has antiallergic, antiinflammatory, antiasthmatic,
 analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
 beta-adrenergic agonist. The composition is useful for preventing or
 treating a respiratory, lung or malignant disease. The administered
 composition comprises oligo and is administered to reduce the production
 or availability, or to increase the degradation of the target mRNA or to
 reduce the amount of target polypeptide present in the lungs. The
 pulmonary obstruction, and/or bronchoconstriction and/or lung
 inflammation, allergies and/or surfactant hypoproduction are associated
 with a disease or condition such as pulmonary vasoconstriction,
 inflammation, allergies, asthma, impeded respiration, respiratory
 distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
 hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary

 XX Testing for bronchial asthma or chronic obstructive pulmonary disease by
 PT comparing the expression level of a marker gene in a biological sample
 PT from a subject with the expression level of the gene in a sample from a
 PT healthy subject.
 XX
 XX Example 11; SEQ ID NO 1921; 241pp; English.
 PS
 XX The present invention describes a method of testing for bronchial asthma
 CC or chronic obstructive pulmonary disease. The method comprises
 CC determining the expression level of a marker gene in a biological sample
 CC from a subject, comparing the expression level determined with the

expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (1) a reagent (I) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a method for producing an animal model for bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene, a ribozyme, a polynucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising a protein encoded by a marker gene; and (7) a DNA chip for testing for bronchial asthma or a chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene. (I) has respiratory and antiasthmatic activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention.

WPI; 2004-441051/41.

Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPK10, KIAA0861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample

PT from a subject.

XX Example 4; Page 87; 289pp; English.

XX The invention relates to a novel method for identifying a subject at risk of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) of the invention which was used to genotype human intercellular adhesion molecule ICAM-1/ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor; BB2; CD54; cell surface glycoprotein P3.58) has been mapped to chromosome 19p13.3-p13.2, ICAM-4 (Landsteiner-Wiener blood group; LW) has been mapped to chromosome 19p13.2-cen and ICAM-5 (telencephalin) has been mapped to chromosome 19p13.2.

Identifying a multifunctional oligomeric compound to modulate expression of RNA comprises identifying an inhibiting antisense strand and inhibiting double-stranded oligomeric compound as multifunctional oligomeric compounds.

Example 2; SEQ ID NO 87; 55pp; English.

The invention describes a method of identifying a multifunctional

CC oligomeric compound to modulate expression of RNA. The method comprises:
 CC contacting a target RNA with one or more double-stranded oligomeric
 CC compounds hybridisable to one or more target regions of the RNA and
 CC identifying double-stranded oligomeric compounds which inhibit target RNA
 CC levels by at least 50%; contacting the target RNA with an antisense
 CC strand of the modulating double-stranded oligomeric compound and
 CC determining whether the antisense strand inhibits target RNA levels by at
 CC least 50%; and identifying the inhibiting antisense strand and the
 CC inhibiting double-stranded oligomeric compound as multifunctional
 CC oligomeric compounds. Also described are: a multifunctional oligomeric
 CC compound identified as above; a method for optimising target region
 CC selection for modulation of RNA expression; a method of modulating RNA
 CC expression; methods of optimising modulation of RNA; a method of
 CC selecting a target region of a gene; a method of selecting an optimised
 CC single-stranded oligomeric compound; a method of selecting an optimised
 CC double-stranded oligomeric compound; a method of selecting a single-
 CC stranded oligomeric compound; a method of selecting a double-stranded
 CC oligomeric compound; a method of identifying one or more optimised double
 CC stranded oligomeric compounds; an oligomeric compound, 8-80 nucleobases
 CC in length, targeted to a target RNA, where the oligomeric compound
 CC specifically hybridises the target RNA and the oligomeric compound
 CC inhibits RNA levels by at least 50% in both single-stranded and double-
 CC stranded forms; and an oligomeric compound, 8-80 nucleobases in length
 CC targeted to a target RNA, where the oligomeric compound has a least 80%
 CC sequence homology to the complement of the target RNA and where the
 CC oligomeric compound inhibits RNA levels by at least 60% in both single-
 CC stranded and double-stranded forms. The method is useful for identifying
 CC a multifunctional oligomeric compound to modulate expression of RNA. This
 CC sequence represents a probe used to detect DNA encoding c-rat to
 CC determine RNA levels following multifunctional oligomeric compound
 CC manipulation.

 DR
 XX Composition comprising enzyme which comprises heterologous functional
 PT domain that provides altered functionality in nucleic acid cleavage
 PT assay, useful for cleaving nucleic acid, and detecting presence of RNA
 PT target.
 XX
 XX Claim 95; SEQ ID NO 1697; 1266pp; English.
 PS
 XX This invention describes a novel composition comprising an enzyme which
 CC contains a heterologous functional domain that provides altered
 CC functionality in a nucleic acid cleavage assay. The enzyme comprises a 5'
 CC nuclease, preferably a thermostable 5' nuclease, or a polymerase which is
 CC altered in sequence related to a naturally occurring sequence of a
 CC polymerase such that it exhibits reduced DNA synthetic activity from that
 CC of the naturally occurring polymerase. Preferably the polymerase is a
 CC thermostable polymerase from a Thermus species such as T. aquaticus, T.
 CC flavus, T. thermophilus, T. filiformis or T. scotoductus. The enzyme
 CC comprises a heterologous functional domain, an amino acid sequence that
 CC provides an improved substrate binding activity in the nucleic acid
 CC cleavage assay and an amino acid sequence that provides improved
 CC background specificity in the nucleic acid cleavage assay. The invasive
 CC cleavage structure comprises a RNA target nucleic acid (a cytochrome
 CC P450, or cytokine RNA). Cleavage of the invasive cleavage structure
 CC generates a non-target cleavage product, which is then detected by
 CC detecting fluorescence, mass or fluorescence energy transfer or by
 CC detecting radioactivity luminescence, phosphorescence, fluorescence
 CC polarisation or charge. The enzyme is useful for cleaving a nucleic acid
 CC which involves exposing a sample (a cell lysate) comprising substrate
 CC nucleic acid to the enzyme which produces at least one detectable
 CC cleavage product. The enzyme is employed for detecting target DNAs and
 CC RNAs comprising wild-type and mutant alleles of genes including genes
 CC from humans, other animal or plant that are or may be associated with
 CC disease or other conditions. In addition, the enzymes may be useful for
 CC detecting and identifying strains of microorganisms including bacteria,
 CC fungi, protozoa, ciliates and viruses, preferably detecting and
 CC identifying viruses having RNA genomes, such as hepatitis C and human
 CC immunodeficiency virus.

 XX PS Example 32; Col 64; 72pp; English.
 XX
 XX The present sequence is that of a mutagenic primer used to generate a
 XX CC truncated functional derivative of human intercellular adhesion molecule-
 XX CC 1 (ICAM-1) lacking the cytoplasmic domains, but containing the
 XX CC transmembrane domain and the extracellular region possessing all 5
 XX CC immunoglobulin-like domains. The primer was used to transform the codon
 XX CC for amino acid Tyr-476 to a TAG stop codon. The mutant protein, designed
 XX CC Y476TAG, was produced in COS cells. Functional derivatives of ICAM-1 (see
 XX CC ABB76147), comprising a soluble fragment of ICAM-1 containing a specific
 XX CC amino acid substitution, are claimed. These have an altered ability to
 XX CC bind lymphocyte function-associated antigen-1 (LFA-1). The invention
 XX CC provides methods for using ICAM-1, its functional derivatives, and
 XX CC antibodies, for the treatment and diagnosis of inflammation,
 XX CC haematopoietic tumour cell metastasis, and ICAM-1-expressing tumours

 XX Novel isolated cells that comprise transcription competent
 XX PT immunodeficiency virus e.g. HIV-1, or immunodeficiency virus-based
 XX PT retroviral vector integrated into its genome, useful for identifying
 XX PT latent HIV activators.
 XX XX
 XX Example 1; Page 33; 71pp; English.
 XX
 XX The present sequence is that of primer Alu (EVI255) for human genomic
 XX CC DNA. This primer was used with primer A (see ACC05121) in alphoid PCR
 XX CC amplifications that demonstrated preferential HIV integration in or near
 XX CC alphoid DNA in latently infected Jurkat cells. The invention provides
 XX CC isolated cells that harbour a latent immunodeficiency virus that is
 XX CC transcription competent, that can be reactivated, and that is an in vitro
 XX CC model for latent HIV infection in vivo. The cells are useful for
 XX CC investigating the nature of latency, and also in drug screening assays to
 XX CC identify agents that activate latent HIV. Such agents are useful for
 XX CC reducing the reservoir of latent HIV. Methods are provided of treating an
 XX CC immunodeficiency virus infection

 XX Detecting apoptosis in a cell, useful for treating cancer, an
 XX PT inflammatory disease, an autoimmune disease or a neurodegenerative
 XX PT disease, comprises detecting a decrease in TGNP activity or expression.
 XX XX
 XX Example 11; Page 80; 110pp; English.
 XX
 XX The invention relates to detecting apoptosis in a cell. The method

CC involves detecting a decrease in trans-Golgi network integral membrane
 CC protein (TGNP) activity or expression by detecting the decrease in TGNP
 CC polypeptide or its homologue, a nucleic acid encoding the polypeptide, a
 CC nucleic acid that hybridizes under stringent conditions to the
 CC aforementioned nucleic acid, or their complements. The method,
 CC polypeptides, nucleic acids and modulators are useful for treating
 CC cancer, an inflammatory disease, an autoimmune disease or a
 CC neurodegenerative disease. The present sequence represents a PCR primer
 CC for amplifying the human TGNP promoter

PT Treatment of airway diseases such as asthma - by topically applying
 PT adenosine-free antisense oligonucleotide to airway epithelium of
 PT subject.
 XX
 PS Claim 5; Page 27; 71pp; English.
 XX
 CC A method for treating airway disease in a subject has been produced,
 CC which involves the topical administration of an essentially adenosine
 CC free antisense oligonucleotide (ON) to the airway epithelium of the
 CC subject. The present sequence is an antisense oligonucleotide HSTCAM1A51
 CC specific for the human intercellular adhesion molecule-1 (CAM-1). The
 CC method can be used to treat airway diseases such as cystic fibrosis,
 CC asthma, chronic obstructive pulmonary disease, bronchitis and other
 CC airway diseases characterised by an inflammatory response. By eliminating
 CC adenosine from the antisense ON, its liberation upon antisense
 CC degradation is prevented, thereby preventing adenosine-induced
 CC bronchoconstriction in patients with hyper-reactive airways

 XX CC The present invention describes a new composition comprising an antisense
 CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
 CC nucleic acids involved in bronchoconstriction, allergies, and/or
 CC inflammation. The ON can have antiinflammatory, antiallergic,
 CC antiasthmatic, cyostatic and analgesic activities. The compositions are
 CC useful for the treatment of diseases associated with inflammation,
 CC impaired airways, including lung disease and diseases whose secondary
 CC effects afflict the lungs of a subject. They can be used for treating
 CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
 CC impaired respiration, respiratory distress syndrome, pain, cystic
 CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
 CC pulmonary disease (COPD), and cancers such as leukemias, lymphomas,
 CC carcinomas, and cancers which may metastasize to the lungs, including
 CC breast and prostate cancer. The reduction of the adenosine content of the
 CC ONs reduces side effects. The A-containing ONs break down with the
 CC release of deoxyadenosine which activates adenosine receptors causing
 CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
 CC nucleotide sequences given in the sequence listing from the present
 CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
 CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
 CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
 CC AAA33992) are specifically claimed ONs from the present invention. N.B.
 CC Sequences given in the disclosure of the present invention do not match
 CC up with their corresponding SEQ ID NO: sequences given in the sequence
 CC listing

 XX CC Low adenosine (A) content antisense oligonucleotides which do not trigger
 CC adenosine receptors during metabolism, useful e.g. for treating cancers
 CC and respiratory obstructions.
 CC Claim 14; Page 145; 1592pp; English.
 CC The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulin and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction
 CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
 CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
 CC fragments and antisense oligonucleotides used in the exemplification of
 CC the present invention

XX
XX Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiqunone.
XX
XX Disclosure; SEQ ID NO 10441; 872pp; English.
XX
XX The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiqunone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiqunone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT New transgenic non-human animal whose genome comprises a polynucleotide
PT encoding human intracellular adhesion molecule-1 domains D1 and D2,
PT useful as a model for studying, or screening agents for treating human
PT rhinovirus infection.
XX
PS Example 3.3; Page 19; 42pp; English.
XX
CC This sequence is a primer which was used to determine the presence of a
CC transgene encoding chimeric human/mouse ICAM-1 (intracellular adhesion
CC molecule-1). The transgenic animals genome comprises a polynucleotide
CC encoding human intracellular adhesion molecule-1 (ICAM-1) domains D1 and
CC D2. The animal of the invention may be used in a method of screening test
CC agents for use in the treatment of a condition associated with or
CC exacerbated by major group human rhinovirus (HRV) infection by
CC administering a test agent to the transgenic non-human animal, and
CC determining whether the test agent substance prevents or delays the onset
CC of the condition or treats or alleviates the condition. The transgenic
CC non-human animal is useful as a model for studying human rhinovirus
CC infection, and for screening of test agent for treating such infections.

 XX Identifying a multifunctional oligomeric compound to modulate expression
 PT of RNA comprises identifying an inhibiting antisense strand and
 PT inhibiting double-stranded oligomeric compound as multifunctional
 PT oligomeric compounds.
 XX Example 2; SEQ ID NO 86; 55pp; English.
 XX The invention describes a method of identifying a multifunctional
 CC oligomeric compound to modulate expression of RNA. The method comprises:
 CC contacting a target RNA with one or more double-stranded oligomeric
 CC compounds hybridisable to one or more target regions of the RNA and
 CC identifying double-stranded oligomeric compounds which inhibit target RNA
 CC levels by at least 50%; contacting the target RNA with an antisense
 CC strand of the modulating double-stranded oligomeric compound and
 CC determining whether the antisense strand inhibits target RNA levels by at
 CC least 50%; and identifying the inhibiting antisense strand and the
 CC inhibiting double-stranded oligomeric compound as multifunctional
 CC oligomeric compounds. Also described are: a multifunctional oligomeric
 CC compound identified as above; a method for optimising target region
 CC selection for modulation of RNA expression; a method of modulating RNA
 CC expression; methods of optimising modulation of RNA; a method of
 CC selecting a target region of a gene; a method of selecting an optimised
 CC single-stranded oligomeric compound; a method of selecting an optimised
 CC double-stranded oligomeric compound; a method of selecting a single-
 CC stranded oligomeric compound; a method of selecting a double-stranded
 CC oligomeric compound; a method of identifying one or more optimised double
 CC -stranded oligomeric compounds; an oligomeric compound, 8-80 nucleobases
 CC in length, targeted to a target RNA, where the oligomeric compound
 CC specifically hybridises the target RNA and the oligomeric compound
 CC inhibits RNA levels by at least 50% in both single-stranded and double-
 CC stranded forms; and an oligomeric compound, 8-80 nucleobases in length
 CC targeted to a target RNA, where the oligomeric compound has a least 80%
 CC sequence homology to the complement of the target RNA and where the
 CC oligomeric compound inhibits RNA levels by at least 60% in both single-
 CC stranded and double-stranded forms. The method is useful for identifying
 CC a multifunctional oligomeric compound to modulate expression of RNA. This
 CC sequence represents a reverse transcriptase PCR primer used to isolate
 CC DNA encoding c-rat to determine RNA levels following multifunctional
 CC oligomeric compound manipulation.

PT regions which are associated with breast cancer in a nucleic acid sample
PT from a subject.
XX
PS Example 4; Page 83; 289pp; English.
XX
CC The invention relates to a novel method for identifying a subject at risk
CC of breast cancer comprising detecting the presence or absence of one or
CC more polymorphic variations associated with breast cancer in a nucleic
CC acid sample from a subject. The method of the invention has cytostatic
CC applications and may be useful for identifying a subject at risk of
CC breast cancer, for early diagnosis, prevention and treatment of breast
CC cancer, possibly via gene therapy, as well as to analyse and predict a
CC response to a breast cancer treatment and in clinical drug trials. The
CC current sequence is that of an extend primer (also described as probe) of
CC the invention which was used to genotype human intercellular adhesion
CC molecule ICAM-1/ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor; BB2
CC CD54; cell surface glycoprotein P3.58) has been mapped to chromosomal
CC position 19p13.3-p13.2, ICAM-4 (Landsteiner-Wiener blood group; LW) has
CC been mapped to chromosomal position 19p13.2-cen and ICAM-5
CC (telencephalin) has been mapped to chromosomal position 19p13.2.

PT New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
PS Claim 1; Page 65; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

 XX New peptide nucleic acid oligomers hybridising to adhesion molecule genes
 PT - are stable anti-sense cpds. of high affinity, partic. for treating
 PT inflammation, viral infection, cancer etc.
 XX Claim 2; Page 35; 57pp; English.
 XX New oligomers are claimed which (A) have at least one peptide nucleic
 CC acid (PNA) subunit and (B) have a sequence hybridisable to AUG region,
 CC coding region, 5'-untranslated region or 3'-untranslated region of ICAM-1
 CC or ELAM-1, or hybridisable to AUG region, coding region, 5'- untranslated
 CC region, exon/intron junction region or 3'-untranslated region of VCAM-1.
 CC The PNAs can be used to target RNA and single stranded DNA (ssDNA) to
 CC produce antisense-type gene regulation moieties. Hence they may be used
 CC therapeutically for modulating cellular adhesion and thus as
 CC antimetastatic agents, anticancer agents, antirhinoviral agents, anti-
 CC AIDS agents and antiinflammatory agents. They may also be useful as
 CC diagnostics, e.g. as probes for specific mRNAs. PNA oligomers have high
 CC affinity for complementary single stranded DNA. They are also able to
 CC form triple helices in which a first PNA strand binds with RNA or ssDNA
 CC and a second PNA strand binds with the resulting double helix or with the
 CC first PNA strand. The PNAs possess no significant charge and are water
 CC soluble, which facilitates cellular uptake. Further, since they contain
 CC amides of non-biological amino acids, they are biostable and resistant to
 CC enzymatic degradation by proteases. The present sequence targets human
 CC intercellular adhesion molecule-1 (ICAM-1) 3' untranslated region

 PT ELAM-1 or VCAM-1 - useful for treating or preventing allo:graft
 PT rejection.
 XX
 XX Example 2; Page 17; 92pp; English.
 XX
 XX AAT30211-T30233, AAT33058-T33112 and AAT36667-T36684 represent antisense
 CC oligonucleotides of the invention. These sequences target regions of the
 CC coding sequences for human intercellular adhesion molecule-1 (ICAM-1),
 CC endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as E-
 CC selectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence
 CC targets the 3' untranslated region (nucleotides 2190-2210) of ICAM-1.
 CC ICAM-1, ELAM-1, and VCAM-1 represent three of the five cell adhesion
 CC molecules involved in the adherence of white blood cells to vascular
 CC endothelium. These sequences can be used in a composition for treating
 CC allograft rejection. The composition contains one of these sequences in
 CC combination with an immunosuppressive agent. The immunosuppressive agent
 CC used in the compositions is brequinar, rapamycin, anti-lymphocyte serum,
 CC a monoclonal antibody against LFA-1 or an antisense oligonucleotide. The
 CC compositions can be used for treating or preventing allograft rejection,
 CC such as cardiac or renal allograft rejection. By using these
 CC compositions, allograft survival times are extended, and donor-specific
 CC transplant tolerance is induced

 XX Conjugates for inhibiting mRNA activity by altering 5' cap structure -
 PT comprising targetting oligo:nucleotide linked to amine or metal complex.

XX
 PS Example 7; Col 17; 19pp; English.
 XX
 CC A novel composition has been produced for inhibiting the activity of an
 CC mRNA molecule. The composition comprises: (a) a targetting portion which
 CC is an oligonucleotide or oligonucleotide analogue specifically
 CC hybridisable with the 5' end of the mRNA molecule; (b) a reactive portion
 CC which is an amine or metal complex that chemically modifies or cleaves
 CC the 5' cap structure of the mRNA molecule; and (c) a linker that connects
 CC the targetting and reactive portions so that, upon hybridisation of the
 CC targeting portion to the mRNA, the reactive portion can contact the 5'
 CC cap. The present sequence represents an antisense oligonucleotide for use
 CC in the inhibiting of mRNA activity. The composition can be used for
 CC masking the 5' cap to inhibit binding of eukaryotic initiation factor 4E
 CC (eIF-4E) to the mRNA or for inhibiting production of a protein encoded by
 CC the mRNA in a eukaryotic cell. This has possible therapeutic
 CC applications, e.g. for treating viral infections. (Updated on 25-MAR-2003

 XX Anti-sense oligo:nucleotide(s) for blocking ICAM-1 mRNA translation - for
 PT treating septic shock, adult respiratory distress syndrome etc.
 PT
 XX Claim 1; Col 21; 16pp; English.
 PS
 XX The sequences given in AAT58071-85 represent oligonucleotides which are
 CC antisense to sequences contained in the pre-mRNA or mature mRNA
 CC transcript of human intercellular adhesion molecule-1 (ICAM-1). These
 CC oligonucleotides may be used for treating septic shock and the
 CC manifestations of septic shock, e.g. inflammation, and vascular and
 CC tissue defects. They are also useful in the treatment of septic shock

CC associated diseases, e.g. adult respiratory distress syndrome, multiple organ failure etc. This sequence represents the oligonucleotide GM1594 which is complementary to bases 84-104 of the ICAM-1 molecule. This CC oligonucleotide inhibits hTNF-alpha-induced ICAM-1 expression by 81%. CC (Updated on 25-MAR-2003 to correct PF field.)

 XX
 CC The specification describes antisense oligonucleotides (AAX52869-X55271)
 CC directed against at least 2 mRNAs selected from target genes, coding and
 CC non-coding regions of RNAs corresponding to target genes, gene initiation
 CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-
 CC end and the juxta-section between coding and non-coding regions and all
 CC segments of RNAs encoding proteins associated with one or more diseases,
 CC conditions or mixtures. The antisense oligonucleotides may be derived
 CC from sequences AAX55272-74. These multiple target oligonucleotides
 CC (specifically AAX55180-271) can be used for the antisense treatment of
 CC diseases and conditions. Typical diseases and conditions are those
 CC associated with impaired respiration and inflammation, including lung
 CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
 CC acute asthma, allergies, asthma, impeded respiration, respiratory
 CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
 CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
 CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
 CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
 CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as

CC well as all types of cancers which may metastasize or have metastasized
 CC to the lungs, including breast and prostate cancer

 XX Selectively ranking nucleic acid molecules, for inhibitory efficiency -
 PT comprises determining the fraction a set of nearest-neighbour nucleic
 PT acid base pair types in a target sequence zone, substituting nearest-
 PT neighbour nucleic acid base pair fractions to determine the fractions and
 PT multiplying.
 PT
 XX Example 1; Col 21-22; 72pp; English.
 PS
 XX This oligonucleotide represents an antisense oligonucleotides (ASO)
 CC targeted to a region in the intercellular adhesion molecule (ICAM)-1 gene
 CC which is generated by a method of selectively ranking nucleic acid
 CC molecules for inhibitory efficiency. The method comprises: (a)
 CC determining the fraction of each of a set of 13 nearest-neighbour nucleic
 CC acid base pair types in a target sequence zone RNA:ASO-DNA hybrid nucleic
 CC acid sequence; (b) substituting nearest-neighbour nucleic acid base pair
 CC fractions into formulas to determine the fractions of each of a series of
 CC 13 nearest-neighbour nucleic acid base pair types to provide determined
 CC fractions; and (c) multiplying the fractions of the 13 nearest-neighbour
 CC nucleic acid base pair types by a stability ranking to the nucleic acid
 CC antisense sequence; where the results are ordered to produce a ranking
 CC of nucleic acid oligomer binding interactions to select sequence zones
 CC for antisense targeting

XX Composition comprising nucleic acid and penetration enhancer - used
PT particularly for delivering therapeutic antisense oligonucleotides across
PT the gastrointestinal mucosa, provides high bioavailability.
XX
XX Example 2; Page 78; 115pp; English.
XX
XX A pharmaceutical composition has been developed which comprises a nucleic
CC acid and at least one penetration enhancer. The compositions are used:
CC (i) to treat or prevent any disease or disorder that can be treated with
CC the nucleic acid, e.g. cancer, Alzheimer's disease, beta-thalassemia,
CC malaria, viral infections (including human immune deficiency virus
CC (HIV)), inflammation, in human or animal medicine; (ii) to investigate
CC the role of a gene or gene product in non-human animals; and (iii) to
CC modulate gene expression in cells, tissues or organs. The compositions
CC provide bioavailability of at least 15, preferably 17-35,%. The
CC penetration enhancer improves: (i) transport of the nucleic acid across
CC the mucosa of the alimentary canal and into cells; and (ii) increases
CC stability of the nucleic acid. Oral administration avoids the
CC complications and expense of intravenous or other methods of
CC administration. AAX18669 to AAX18799 and AAX18801 represent antisense
CC oligonucleotides which can be used as the nucleic acid in the method of
CC the invention

XX
XX Generation of antisense oligonucleotides - by specifically targeting a
PT GGGA motif found in mRNA sequences.
XX
XX Example 2; Page 37; 55pp; English.
XX
XX Antisense oligonucleotides (ASO) for inhibiting a tumour necrosis factor-
CC alpha (TNF-alpha) gene in an animal, preferably a human, comprise 12-50
CC nucleotides, 90% of which are complementary to a region of mRNA
CC containing a GGGA sequence motif. The ASO is used to inhibit expression
CC of a gene in an animal and for treating the animal when afflicted with a
CC disease or disorder characterised by the presence of an mRNA from a gene
CC containing a GGGA motif. The ASO are specifically targeted to a GGGA
CC sequence motif found in mRNA from a gene. A study of known ASO has shown
CC that at least half of the most efficacious ASO's contain one or more TCCC
CC motifs. This ASO comprises a TCCC motif followed by a cytosine residue
CC and corresponds to a region of the human ICM-1 3' untranslated region

 XX New compositions comprising sensor arrays made up of unique probe
 PT oligonucleotides - useful for characterizing a sample of target deletion
 PT oligonucleotides.
 PT
 XX
 PS Example 9; Page 100; 163pp; English.
 XX
 CC This invention describes a novel composition comprising a number of
 CC sensor arrays, where each array comprises a unique probe oligonucleotide,
 CC which is the reverse complement of part of a unique target
 CC oligonucleotide present in a mixture of target deletion sequence
 CC oligonucleotides. The compositions form a method for characterizing a
 CC sample of target deletion oligonucleotides which are labelled and
 CC hybridize with the probe oligonucleotides of the sensor arrays. Such
 CC oligonucleotides and their targets are represented in AAX23548-X23709.
 CC Oligonucleotides characterized by the method form pharmaceutical
 CC compositions that are useful for modulating cellular adhesion or
 CC proliferation, and being active against a eukaryotic pathogen, a human
 CC retrovirus, a human immunodeficiency virus (HIV), or a non-human
 CC retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
 CC Syncytial Virus or cytomegalovirus (CMV). The compositions enable
 CC characterization of deletion sequence oligonucleotides having related,
 CC but different nucleobase sequences, and quantification of different
 CC species of deletion sequence ("target") oligonucleotides in a mixture.
 CC Also, if the specificity of the oligonucleotide's nucleobase sequence for
 CC its reverse complement is not modified, the method may be performed using
 CC oligodeoxynucleotides

 PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
 PT cancers.
 XX
 PS Claim 18; Page 400; 1343pp; English.
 XX
 CC The present invention describes a new composition comprising an antisense
 CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
 CC nucleic acids involved in bronchoconstriction, allergies, and/or
 CC inflammation. The ON can have antiinflammatory, antiallergic,
 CC antiasthmatic, cytosstatic and analgesic activities. The compositions are
 CC useful for the treatment of diseases associated with inflammation,
 CC impaired airways, including lung disease and diseases whose secondary
 CC effects afflict the lungs of a subject. They can be used for treating
 CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
 CC impaired respiration, respiratory distress syndrome, pain, cystic
 CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
 CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
 CC carcinomas, and cancers which may metastasise to the lungs, including
 CC breast and prostate cancer. The reduction of the adenosine content of the
 CC ONs reduces side effects. The A-containing ONs break down with the
 CC release of deoxyadenosine which activates adenosine receptors causing
 CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
 CC nucleotide sequences given in the sequence listing from the present
 CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
 CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
 CC from the previously named sequences. SEQ ID NO:11 to 1880 (AAA32323 to
 CC AAA33992) are specifically claimed ONs from the present invention. N.B.
 CC Sequences given in the disclosure of the present invention do not match
 CC up with their corresponding SEQ ID NO: sequences given in the sequence
 CC listing

 CC Sequences AAZ49336-Z49343 and AAZ49390 represent antisense
 CC oligonucleotides designed to modulate cellular adhesion. The invention
 CC relates to new compositions for the non-parenteral delivery of
 CC oligonucleotides comprising at least one oligonucleotide in an emulsion.
 CC Oligonucleotides delivered via the compositions of the invention can be
 CC used to modulate expression of a cellular adhesion protein, modulate a
 CC rate of cellular proliferation, or have biological activity against
 CC eukaryotic pathogens or retroviruses. They can be used for treating
 CC conditions including e.g., ulcerative colitis, Crohn's disease,
 CC inflammatory bowel disease or undue cellular proliferation. The
 CC compositions can enhance the local and systemic uptake and delivery of
 CC nucleic acids via non-parenteral routes of administration (e.g., via the
 CC alimentary canal, skin, eyes, pulmonary tract, urethra or vagina)

 PT and respiratory obstructions.
 XX
 PS Claim 14; Page 145; 1592pp; English.
 XX
 CC The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and/or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction
 CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
 CC and/or cancer. AAFL8434 to AAFL21543 represent human polynucleotide
 CC fragments and antisense oligonucleotides used in the exemplification of
 CC the present invention

PT conditions, psoriasis, graft rejection, cancers, infections,
PT cardiovascular disorders or autoimmune disorders.
PT
XX Example 7; Page 65; 199pp; English.
PS
XX This sequence is an antisense oligonucleotide of the invention. The
CC antisense oligonucleotides are targeted to a nucleic acid encoding a
CC cellular adhesion molecule (CAM) and is capable of modulating the
CC expression of the CAM. They particularly inhibit intercellular adhesion
CC molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), or
CC endothelial leukocyte adhesion molecule-1 (ELAM-1). The antisense
CC oligonucleotides can be used to modulate CAM activity in mediating
CC cell-cell interactions and subsequent cellular and biological responses,
CC e.g. T cell activation, leukocyte transmigration and inflammation. The
CC antisense sequences can be used for modulating the synthesis of a CAM.
CC They can be used for treating an animal suspected of having or being
CC prone to a disease or condition associated with a CAM. Oligonucleotides
CC targeted to ICAM-1 can be used for treating an inflammatory disease or
CC condition e.g. inflammatory bowel disease such as Crohn's disease,
CC colitis or ulcerative colitis, a condition of the skin, e.g. psoriasis or
CC cytotoxic dermatitis, rheumatoid arthritis, allograft rejection, cancer,
CC pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences
CC can also be used for reducing corticosteroid use in a patient or for
CC reducing cyclosporine use in a patient. The oligonucleotides can also be
CC used for detection and diagnosis. They can also be used for treating e.g.
CC hyperproliferative disorders, tumours, diapedesis, graft versus host
CC disease, arthritis, infections, autoimmune disorders, e.g. autoimmune
CC thyroid disorders, autoimmune forms of arthritis, multiple sclerosis,
CC some forms of juvenile diabetes mellitus, myasthenia gravis, pemphigus
CC vulgaris, systemic lupus erythematosus, cardiovascular disorders, acute
CC myocardial ischaemia/reperfusion injury, dilated cardiomyopathy, acute
CC myocarditis, ischaemic heart disease or stroke

XX
XX Identifying a nucleic acid having a sequence capable of targeting a gene
PT of interest, for identifying nucleic acids for gene therapy, comprises
PT using the Nearest-Neighbor Thermal Stability Program.
XX
XX Example 1; Col 27-28; 43pp; English.
XX
XX The present invention describes a method for the identification of a
CC nucleic acid having a sequence capable of targeting a gene of interest
CC comprises: (a) a first database having a list of stability values for
CC independent combinations of N(x); (b) a computing unit having a means for
CC inputting data comprising N(x); data list, defining a nucleic acid
CC sequence of interest to be targeted to provide a second database; and (c)
CC a program capable of processing the first and second database to N(x)
CC comparison, and a stability value of a nucleic acid sequence capable of
CC targeting the gene of interest. The method is useful for identifying a
CC nucleic acid having a sequence capable of targeting a gene of interest.
CC These nucleic acids are useful in gene therapy and disease treatment. The
CC method may be used to obtain thermodynamic parameters for 20 combinations
CC of nearest-neighbour base pairs of DNA:RNA hybrid sequences. The Nearest-
CC Neighbour Thermal Stability Program can process data for use in
CC calculating thermal melting temperatures for phosphorothioate DNA:RNA
CC hybrids. The program can be readily extended to predict the most stable
CC triplex-forming sequences, or antigene oligomers. The present sequence
CC represents an antisense DNA oligomer designated S-ASO targeted to the
CC human intracellular adhesion molecule 1 (ICAM-1), which is used in an
CC example from the present invention

 XX
 XX New cells recombinantly altered to express an exogenous AK155 cytokine
 PT receptor, useful for identifying agents for treating AK155-mediated
 PT diseases, e.g. inflammation, angiogenesis or cancer.
 XX
 XX Example 2; Page 51; 100pp; English.
 PS
 XX The present invention relates to a cell recombinantly altered to express
 CC an exogenous AK155 cytokine receptor comprising alpha and beta subunits.
 CC The cytokine receptor, when expressed in Ba/F3 cells, binds to AK155 and
 CC stimulates binding of STAT3 to interferon (IFN) gamma-activated
 CC sequences. The cell is useful in expressing AK155 cytokine receptor which
 CC may be used for identifying therapeutic agents useful for treating AK155-
 CC mediated conditions or diseases, such as inflammation (e.g. Crohn's
 CC disease), autoimmune diseases (e.g. multiple sclerosis, rheumatoid
 CC arthritis, psoriasis, asthma, allergies, diabetes mellitus, Sjogren's
 CC syndrome), transplant rejection, angiogenesis, and cancer. The current
 CC sequence represents an ICAM-1 reverse primer sequence

PS Claim 15; SEQ ID NO 10449; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposcretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiasthmatic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of

CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

XX compound for treating schizophrenia comprising assaying nucleic acid for
XX a codon encoding arginine at amino acid position 241 of intercellular
XX adhesion molecule-1.

XX PS Disclosure; SEQ ID NO 6; 34pp; English.

XX CC The present invention relates to a method for screening for
XX schizophrenia. The method comprises assaying a DNA sample for the
XX presence of a codon encoding arginine at amino acid position 241 of the
XX intercellular adhesion molecule-1 (ICAM-1) protein or a protein sample
XX for the presence of the ICAM-1 protein having the 241A polymorphism,
XX where the presence of a codon encoding arginine at amino acid position
XX 241 of the ICAM-1 protein or of the polymorphism is indicative of a
XX schizophrenia. The method is useful for predicting clinical response to a
XX therapeutic compound in the treatment of ICAM-1 mediated schizophrenia.
XX The present sequence is a PCR primer, which was used in an example from
XX the invention.

XX PT Assessing culture of undifferentiated primate pluripotent stem cells by
XX PT detecting expression of markers e.g., Zic family member 3, other than
XX PT human telomerase reverse transcriptase/octamer binding transcription
XX PT factor.
XX PS Example 4; SEQ ID NO 77; 106pp; English.
XX CC The invention relates to assessing a culture of undifferentiated primate
XX CC pluripotent stem cells (pPS, e.g. embryonic stem cells), involving
XX CC detecting expression of markers (MR1) e.g. Zic family member 3 (ZIC3), as
XX CC given in specification, other than human telomerase reverse transcriptase
XX CC (hTERT) or octamer binding transcription factor (Oct)3/4, or a marker
XX CC (MR2) such as crypto or podocalyxin-like protein and hTERT and/or Oct3/4
XX CC or second marker chosen from (MR2). Also included are maintaining (M2)
XX CC pPS cells in a pluripotent state (involves causing them to express one of
XX CC the following markers (MR3) at a higher level, FOXO1A, ZIC3, hypothetical
XX CC KRAB-zinc finger protein SZFI-1 or zinc finger protein of cerebellum
XX CC ZIC2, or any other marker (MR4) chosen from PHD protein Jade-1 (Jade-1),
XX CC kruppel-like zinc finger protein (ZNF300), etc., as given in the
XX CC specification), causing pPS cells to differentiate into a particular
XX CC tissue type by causing them to express one of the markers chosen from
XX CC (MR3) or (MR4) (or markers chosen from GATA binding protein 3 (GATA3),
XX CC core promoter element binding protein (COPEB), etc., as given in the
XX CC specification), maintaining pPS cells in a pluripotent state (involves
XX CC culturing pPS cells or their progeny in the presence of a normally
XX CC secreted protein that is encoded by a gene that down-regulated upon
XX CC differentiation of human embryonic stem (hES) cells, chosen from
XX CC Fibrillin 3 gene, LEFT B gene, ZIC3 gene, EPHA1 gene, etc., as given in
XX CC the specification), causing pPS cells to differentiate (involves
XX CC culturing pPS cells or their progeny in the presence of a normally
XX CC secreted protein that is encoded by a gene that up-regulated upon
XX CC differentiation of hES cells, chosen from P311 protein gene, Tax
XX CC interaction protein 1 gene, KIAA0853 protein gene, keratin 19 (KRT 19)
XX CC gene, etc., as given in the specification), causing an encoding sequence
XX CC to be preferentially expressed in undifferentiated pPS cells, causing an
XX CC encoding sequence to be preferentially expressed in differentiated cells,
XX CC sorting (M4) differentiated cells from less differentiated cells
XX CC (involves separating cells expressing a surface marker chosen from any
XX CC one of MR1 from cells not expressing the marker), causing pPS cells to
XX CC proliferate without differentiation, identifying genes that are up or
XX CC down regulated during differentiation of pPS cells, and a kit (I) for
XX CC assessing a culture of pPS cells by M1. The method (M1) is useful for
XX CC assessing culture of undifferentiated primate pluripotent stem cells and
XX CC for assessing the growth characteristics of a cell population. The cell
XX CC population has been obtained by culturing cells from human blastocyst or
XX CC from a human patient suspected of having a clinical condition related to
XX CC abnormal cell growth. The method further involves determining whether the
XX CC cell population is pluripotent from the marker expression and assessing

```

```

CC whether the patient has a malignancy from the marker expression. The
CC present sequence is an RTQ-PCR probe (realtime quantitative PCR) used to
CC assay the expression of a human mRNA in a pPS population.

 DR XX Testing for bronchial asthma or chronic obstructive pulmonary disease by
 XX PT comparing the expression level of a marker gene in a biological sample
 PT PT from a subject with the expression level of the gene in a sample from a
 XX PT healthy subject.
 XX PS Example 11; SEQ ID NO 1923; 241pp; English.
 XX CC The present invention describes a method of testing for bronchial asthma
 CC or chronic obstructive pulmonary disease. The method comprises
 CC determining the expression level of a marker gene in a biological sample
 CC from a subject, comparing the expression level determined with the
 CC expression level of the marker gene in a biological sample from a healthy
 CC subject, and judging whether the subject has bronchial asthma or chronic
 CC obstructive pulmonary disease. The marker gene comprises: (a) a group of
 CC genes (S1) whose expression levels increase when respiratory epithelial
 CC cells are stimulated with interleukin-13; or (b) a group of genes (S2)
 CC whose expression levels decrease when respiratory epithelial cells are
 CC stimulated with interleukin-13. Also described: (1) a reagent (I) for
 CC testing for bronchial asthma or chronic obstructive pulmonary disease;
 CC (2) a kit for screening for a candidate compound for a therapeutic agent
 CC to treat bronchial asthma or chronic obstructive pulmonary disease; (3)
 CC an animal model for bronchial asthma or chronic obstructive pulmonary
 CC disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a
 CC method for producing an animal model for bronchial asthma or chronic
 CC obstructive pulmonary disease; (6) a therapeutic agent for bronchial
 CC asthma or chronic obstructive pulmonary disease, comprising the compound,
 CC a marker gene or an antisense nucleic acid corresponding to a portion of
 CC the marker gene, a ribozyme, a polynucleotide that suppresses the
 CC expression of the gene through an RNAi effect or an antibody recognising
 CC a protein encoded by a marker gene; and (7) a DNA chip for testing for
 CC bronchial asthma or a chronic obstructive pulmonary disease, on which a
 CC probe has been immobilised to assay a marker gene. (I) has respiratory
 CC and antiasthmatic activities, and can be used in gene therapy. The method
 CC is useful for testing for or screening for a therapeutic agent for
 CC bronchial asthma or chronic obstructive pulmonary disease. The present
 CC sequence is used in the exemplification of the present invention.

 XX New antisense oligonucleotide, useful for diagnosing, as research
 PT reagents and for treating disease states, which respond to modulation of
 PT the synthesis or metabolism of cell adhesion molecules.
 XX Example 5; SEQ ID NO 3; 72pp; English.
 XX The invention relates to an antisense oligonucleotide targeting human
 CC intercellular adhesion molecule (ICAM-1) having a sequence appearing as
 CC ADM46473. In the oligonucleotide, at least one adenosine nucleotide is
 CC replaced with a thymidine, cytidine or guanosine nucleotide, at least one
 CC thymidine nucleotide is replaced with an adenosine, cytidine or guanosine
 CC nucleotide, at least one guanosine nucleotide is replaced with an
 CC adenosine, thymidine or cytidine nucleotide or at least one cytidine
 CC nucleotide is replaced with an adenosine, cytidine or guanosine
 CC nucleotide. The oligonucleotide is one of 88 disclosed antisense
 CC oligonucleotides targeting ICAM-1, vascular cell adhesion molecule (VCAM-
 CC 1) or endothelial leukocyte adhesion molecule (ELAM-1). Also included are
 CC an RNA compound 8-80 nucleobases in length targeted to human ICAM-1 mRNA
 CC (where the compound specifically hybridises with the human ICAM-1 mRNA
 CC and inhibits the expression of human ICAM-1 mRNA), and a double stranded
 CC RNA compound having the RNA equivalent sequence of ADM46473. The
 CC oligonucleotide is useful for modulating the activity of the RNA and DNA
 CC and the modulation of the synthesis and metabolism of specific cell
 CC adhesion molecules. It is also useful for the diagnosis, as research
 CC reagents and for treating disease states, which respond to modulation of
 CC the synthesis or metabolism of cell adhesion molecules. The
 CC oligonucleotide is suitable for treating inflammatory ophthalmological

CC disorders including redness and inflammation caused by allergens and
 CC allergic reactions. The oligonucleotides can also be used to preserve
 CC corneal explants ex vivo and to prevent corneal allograft rejections. The
 CC specific hybridisation exhibited by the oligonucleotides may be used for
 CC assays, purifications or cellular product preparations. The present
 CC sequence is an antisense oligonucleotide targeting ICAM-1.

XX Predicting antisense activity of an oligonucleotide for down-regulating
 PT expression of an RNA, comprises developing an artificial neural network,
 PT determining counts of mapped sequence motifs, and obtaining a output of
 PT activity.

PS Disclosure; SEQ ID NO 13; 25pp; English.

XX The present invention relates to the method for making an artificial
 CC neural network embodied on a computer-readable medium for predicting
 CC antisense activity of oligonucleotides for down-regulating expression of
 CC a selected RNA. The invention provides a five-fold reduction in the
 CC number of oligonucleotides to be screened in vivo to find effective
 CC targets. The present sequence is human ICAM-specific antisense
 CC oligonucleotide. This sequence is used in the invention.

XX Targeting an antisense oligonucleotide to hepatic tissues to modulate the
 PT expression of a gene in the liver involves conjugating the
 PT oligonucleotide to a cholesteryl moiety and administering the conjugate.

XX Disclosure; SEQ ID NO 26; 64pp; English.

XX The invention relates to a method of targeting an antisense
 CC oligonucleotide to hepatic tissues involving conjugating the
 CC oligonucleotide to a cholesteryl moiety and administering the conjugate.
 CC The method is useful for targeting an antisense oligonucleotide to
 CC hepatic tissues to modulate the expression of a gene in the liver. The
 CC oligonucleotide is useful in diagnostics, therapeutics, as research
 CC reagents and kits, in pharmaceutical composition and for treating
 CC diseases produced by undesired production of proteins. The method
 CC provides lipophilic oligonucleotide conjugates with improved biostability
 CC and altered biodistribution in mammals. The present sequence represents
 CC an oligonucleotide.

 XX
 PS Disclosure; SEQ ID NO 23; 71pp; English.
 XX
 CC The present invention relates to novel small interfering RNAs (siRNAs)
 CC comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially
 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.

 PT Novel isolated small interfering RNA comprising sense RNA strand having
 PT sequence identical to human intracellular adhesion molecule mRNA, and
 PT antisense RNA strand, useful for treating angiogenic diseases such as
 PT cancer.
 XX
 PS Disclosure; SEQ ID NO 35; 71pp; English.

CC The present invention relates to novel small interfering RNAs (siRNAs)
 CC comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially
 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I

CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,

 CC The present invention relates to novel small interfering RNAs (siRNAs)
 CC comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially

CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.

XX Disclosure; SEQ ID NO 52; 71pp; English.

XX The present invention relates to novel small interfering RNAs (siRNAs) comprising sense and antisense RNA strands forming a RNA duplex, where the sense RNA strand comprises nucleotide sequence substantially identical to a target sequence of 19-25 contiguous nucleotides in human or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix interactions. The siRNAs of the invention specifically target and cause RNA-interference induced degradation of mRNA from ICAM-1 genes thus leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful for inhibiting cell adhesion or cell adhesion-mediated pathologies such as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis, Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic nephritis, immune-based nephritis, contact dermal hypersensitivity, corneal/limbic injury, type I diabetes, complications arising from type I diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung diseases, inflammatory sequelae of viral infections, inflammatory skin disorders, allograft rejection, immune cell interactions such as T-cell killing, mixed lymphocyte reaction, T-cell mediated B-cell differentiation, meningitis, multiple sclerosis, multiple myeloma, myocarditis, pulmonary fibrosis, reperfusion injury, restenosis, retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour metastasis and uveitis. The siRNAs are also useful for treating an angiogenic disease such as cancer, diabetic retinopathy age-related macular degeneration, preferably age-related macular degeneration. The siRNAs are also useful for treating complications arising from type I diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic nephropathy and macrovascular disease. The macrovascular disease is coronary artery disease, cerebrovascular disease or peripheral vascular disease. The present oligonucleotide is a ICAM-1 target sequence from which the siRNAs of the invention can be derived.

 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.

 DR Novel isolated small interfering RNA comprising sense RNA strand having
 XX sequence identical to human intracellular adhesion molecule mRNA, and
 PT antisense RNA strand, useful for treating angiogenic diseases such as
 PT cancer.
 XX Disclosure; SEQ ID NO 25; 71pp; English.
 PS The present invention relates to novel small interfering RNAs (siRNAs)
 CC comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially
 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, restenosis,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.

CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
CC interactions. The siRNAs of the invention specifically target and cause
CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
CC Alzheimer's disease, angioneurosis, asthma, atherosclerosis, toxic
CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
CC corneal/limbic injury, type I diabetes, complications arising from type I
CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
CC diseases, inflammatory sequelae of viral infections, inflammatory skin
CC disorders, allograft rejection, immune cell interactions such as T-cell
CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
CC metastasis and uveitis. The siRNAs are also useful for treating an
CC angiogenic disease such as cancer, diabetic retinopathy age-related
CC macular degeneration, preferably age-related macular degeneration. The
CC siRNAs are also useful for treating complications arising from type I
CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
CC nephropathy and macrovascular disease. The macrovascular disease is
CC coronary artery disease, cerebrovascular disease or peripheral vascular
CC disease. The present oligonucleotide is the antisense strand for one such
CC ICAM-1 siRNA. The corresponding sense strand is given in ADQ82752.

 PS
 XX The present invention relates to novel small interfering RNAs (siRNAs)
 CC comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially
 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, anglogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.

 PT antisense RNA strand, useful for treating angiogenic diseases such as
 PT cancer.
 XX
 XX Example 1; SEQ ID NO 58; 71pp; English.
 XX
 XX The present invention relates to novel small interfering RNAs (siRNAs)
 CC comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially
 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.
 XX

XX
XX The present invention relates to novel small interfering RNAs (siRNAs)
CC comprising sense and antisense RNA strands forming a RNA duplex, where
CC the sense RNA strand comprises nucleotide sequence substantially
CC identical to a target sequence of 19-25 contiguous nucleotides in human
CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
CC interactions. The siRNAs of the invention specifically target and cause
CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
CC corneal/limbic injury, type I diabetes, complications arising from type I
CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
CC diseases, inflammatory sequelae of viral infections, inflammatory skin
CC disorders, allograft rejection, immune cell interactions such as T-cell
CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
CC differentiation, meningitis, multiple sclerosis, restenosis,
CC myocarditis, pulmonary fibrosis, reperfusion injury, stroke, tumour
CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
CC metastasis and uveitis. The siRNAs are also useful for treating an
CC angiogenic disease such as cancer, diabetic retinopathy age-related
CC macular degeneration, preferably age-related macular degeneration. The
CC siRNAs are also useful for treating complications arising from type I
CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
CC nephropathy and macrovascular disease. The macrovascular disease is
CC coronary artery disease, cerebrovascular disease or peripheral vascular
CC disease. The present oligonucleotide is a ICAM-1 target sequence from
CC which the siRNAs of the invention can be derived.

PT antisense RNA strand, useful for treating angiogenic diseases such as
 XX cancer.
 XX
 PS Disclosure; SEQ ID NO 44; 71pp; English.
 XX
 XX The present invention relates to novel small interfering RNAs (siRNAs)
 CC comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially
 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.

 PT antisense RNA strand, useful for treating angiogenic diseases such as
 PT cancer.

XX Disclosure; SEQ ID NO 78; 71pp; English.

XX The present invention relates to novel small interfering RNAs (siRNAs)
 XX comprising sense and antisense RNA strands forming a RNA duplex, where
 CC the sense RNA strand comprises nucleotide sequence substantially
 CC identical to a target sequence of 19-25 contiguous nucleotides in human
 CC or mouse intracellular adhesion molecule-1 (ICAM-1) nucleotide sequence
 CC (ADQ82749 and ADQ82750). ICAMs mediate cell-cell and cell-matrix
 CC interactions. The siRNAs of the invention specifically target and cause
 CC RNA-interference induced degradation of mRNA from ICAM-1 genes thus
 CC leading to inhibition of ICAM-1 mRNA expression. The siRNAs are useful
 CC for inhibiting cell adhesion or cell adhesion-mediated pathologies such
 CC as AIDS-related dementia, allergic conjunctivitis, allergic rhinitis,
 CC Alzheimer's disease, angiogenesis, asthma, atherosclerosis, toxic
 CC nephritis, immune-based nephritis, contact dermal hypersensitivity,
 CC corneal/limbic injury, type I diabetes, complications arising from type I
 CC diabetes, Graves' disease, inflammatory bowel disease, inflammatory lung
 CC diseases, inflammatory sequelae of viral infections, inflammatory skin
 CC disorders, allograft rejection, immune cell interactions such as T-cell
 CC killing, mixed lymphocyte reaction, T-cell mediated B-cell
 CC differentiation, meningitis, multiple sclerosis, multiple myeloma,
 CC myocarditis, pulmonary fibrosis, reperfusion injury, restenosis,
 CC retinitis, rheumatoid arthritis, septic arthritis, stroke, tumour
 CC metastasis and uveitis. The siRNAs are also useful for treating an
 CC angiogenic disease such as cancer, diabetic retinopathy age-related
 CC macular degeneration, preferably age-related macular degeneration. The
 CC siRNAs are also useful for treating complications arising from type I
 CC diabetes such as diabetic retinopathy, diabetic neuropathy, diabetic
 CC nephropathy and macrovascular disease. The macrovascular disease is
 CC coronary artery disease, cerebrovascular disease or peripheral vascular
 CC disease. The present oligonucleotide is a ICAM-1 target sequence from
 CC which the siRNAs of the invention can be derived.

 PT GRP receptor.
 XX
 PS Disclosure; SEQ ID NO 78; 57pp; English.
 CC
 CC The invention relates to assessing a culture of undifferentiated human
 CC embryonic stem (hES) cells (undifferentiated primate pluripotent stem
 CC cells) or their progeny, involves detecting or measuring a marker such as
 CC Cripto (teratocarcinoma-derived growth factor), gastrin-releasing peptide
 CC (GRP) receptor and podocalyxin-like protein, and either hTERT (telomerase
 CC reverse transcriptase) and/or Oct3/4 (also known as POU domain, class 5,
 CC transcription factor 1 (POU5F1), or GRP receptor. The method involves
 CC detecting or measuring at least two markers, and detecting or measuring
 CC hTERT and/or Oct3/4. The expression of the marker(s) is detected or
 CC measured at mRNA level by PCR amplification. The expression of the
 CC marker(s) is detected or measured at the protein level by antibody assay.
 CC The method involves quantifying the proportion of undifferentiated hES
 CC cells or differentiated cells in the culture from the marker expression.
 CC The level of the marker is determined to be at least 100-fold higher than
 CC the level of the marker in BJ fibroblasts or is determined to be no less
 CC than 100-fold lower than the level of the marker in hES cells, cultured
 CC on an extracellular matrix in medium conditioned with mouse embryonic
 CC fibroblasts and containing 4 ng/ml basic fibroblast growth factor. The
 CC method further involves modifying the culture conditions so as to cause
 CC the hES cells to increase expression of the marker detected or measured
 CC in the culture. The method is useful for assessing a culture of

CC undifferentiated hES cells or their progeny. The marker used in the above
 CC method is useful for characterising pluripotent stem cells and their
 CC differentiated progeny, for clinical diagnosis of cancer, for assessing
 CC and manipulating culture conditions, regulating gene expression, cell
 CC separation and purification, and to influence differentiation. The
 CC present sequence is a real time quantitative PCR primer used to assay
 CC mRNA expression in undifferentiated stem cells.

XX Assessing culture of undifferentiated human embryonic stem cells or their
 PT progeny, by detecting Cripto, gastrin-releasing peptide (GRP) receptor

PT and podocalyxin-like protein markers, and either hTERT and/or Oct3/4, or
 PT GRP receptor.

PS Disclosure; SEQ ID NO 76; 57pp; English.

XX The invention relates to assessing a culture of undifferentiated human
 CC embryonic stem (hES) cells (undifferentiated primate pluripotent stem
 CC cells) or their progeny, involves detecting or measuring a marker such as
 CC Cripto (teratocarcinoma-derived growth factor), gastrin-releasing peptide
 CC (GRP) receptor and podocalyxin-like protein, and either hTERT (telomerase
 CC reverse transcriptase) and/or Oct3/4 (also known as POU domain, class 5,
 CC transcription factor 1 (POU5F1)), or GRP receptor. The method involves
 CC detecting or measuring at least two markers, and detecting or measuring
 CC hTERT and/or Oct3/4. The expression of the marker(s) is detected or
 CC measured at mRNA level by PCR amplification. The expression of the
 CC marker(s) is detected or measured at the protein level by antibody assay.
 CC The method involves quantifying the proportion of undifferentiated hES
 CC cells or differentiated cells in the culture from the marker expression.
 CC The level of the marker is determined to be at least 100-fold higher than
 CC the level of the marker in BJ fibroblasts or is determined to be no less
 CC than 100-fold lower than the level of the marker in hES cells, cultured
 CC on an extracellular matrix in medium conditioned with mouse embryonic
 CC fibroblasts and containing 4 ng/ml basic fibroblast growth factor. The
 CC method further involves modifying the culture conditions so as to cause
 CC the hES cells to increase expression of the marker detected or measured
 CC in the culture. The method is useful for assessing a culture of
 CC undifferentiated hES cells or their progeny. The marker used in the above
 CC method is useful for characterising pluripotent stem cells and their
 CC differentiated progeny, for clinical diagnosis of cancer, for assessing
 CC and manipulating culture conditions, regulating gene expression, cell
 CC separation and purification, and to influence differentiation. The
 CC present sequence is a real time quantitative PCR primer used to assay
 CC mRNA expression in undifferentiated stem cells.

 PT Modulating the expression of a nucleic acid in the hepatic system, useful
 PT for treating hepatic disorders, comprises administering to the mammal an
 PT oligonucleotide that hybridizes to the nucleic acid to modulate its
 PT expression.
 XX
 PS Example 7; SEQ ID NO 70; 98pp; English.
 XX
 CC This invention relates to a novel method of modulating the expression of
 CC a nucleic acid in the hepatic system of a mammal which comprises
 CC administering to the mammal an oligonucleotide that hybridizes to the
 CC nucleic acid to modulate the expression of the nucleic acid, where the
 CC oligonucleotide has two sterol groups that are covalently bonded. The
 CC invention may be useful for the development of a compound with
 CC hepatotropic activity whilst the genetic sequences of the invention may
 CC prove useful for gene therapy. The methods are useful for treating
 CC hepatic disease or disorder associated with a protein encoded by a gene.
 CC Note: These oligonucleotides may have one or more of several
 CC modifications which are detailed in the specification, including having a
 CC phosphorothioate backbone or having ribonucleoside bases.

 PT of polymorphic variations in the ICAM, MAPK10, KIAA0861, NUMA1 or GALE
 PT regions which are associated with breast cancer in a nucleic acid sample
 PT from a subject.
 XX
 PS Example 4; Page 82; 289pp; English.
 XX

CC The invention relates to a novel method for identifying a subject at risk
 CC of breast cancer comprising detecting the presence or absence of one or
 CC more polymorphic variations associated with breast cancer in a nucleic
 CC acid sample from a subject. The method of the invention has cytostatic
 CC applications and may be useful for identifying a subject at risk of
 CC breast cancer, for early diagnosis, prevention and treatment of breast
 CC cancer, possibly via gene therapy, as well as to analyse and predict a
 CC response to a breast cancer treatment and in clinical drug trials. The
 CC current sequence is that of an Extend primer (also described as probe) of
 CC the invention which was used to genotype human intercellular adhesion
 CC molecule ICAM-1/ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor;BB2
 CC ;CD54;cell surface glycoprotein P3.58) has been mapped to chromosome
 CC position 19p13.3-p13.2, ICAM-4 (Landsteiner-Wiener blood group;LW) has
 CC been mapped to chromosome position 19p13.2-cen and ICAM-5
 CC (telencephalin) has been mapped to chromosome position 19p13.2.

 XX Table 7; Page 324; 517pp; English.
 XX
 CC The sequence is that of a bovine microsatellite sequence obtd. by
 CC screening a library of bovine MboI DNA fragments of between 250 and 500
 CC bp with an (AC)₁₅ and a (TC)₁₅ oligonucleotide probe. One out of 50
 CC clones cross-hybridised. Assuming independent distribution of
 CC microsatellites and MboI sites, the frequency of (T6)_n >9 microsatellites
 CC in the bovine genome is estimated at >100, 000. The sequence information
 CC for ca. 230 such bovine microsatellites is summarised in the
 CC specification and indexed herein (see below). The sequences upstream and
 CC downstream of the microsatellite sequence were used to generate the
 CC required PCR primers for in vitro amplification of the corresp.
 CC microsatellite (using the program OPTIPRIM). The microsatellites may be
 CC used to identify individuals, for parentage testing, and in the genetic
 CC mapping of economic trait loci, or genes involved the determination of
 CC economically important traits esp. in cattle, to allow selective
 CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
 CC field.)

XX Measuring target polynucleotide sequences in biological samples by
PT contacting sequence-selective primer pairs, forming conjugates with
PT adaptor molecules, polymerizing target-identifier dimers and quantifying
PT them.
XX
XX Disclosure; Page 99; 103pp; English.
XX
XX A novel method for simultaneously determining the level of a number of
CC target polynucleotides in a sample has been disclosed. The method
CC involves forming double stranded copies of the target sequence in direct
CC proportion to the target levels in the original sample. The target
CC sequence is copied using primer pairs designed to flank a defined region
CC in the target sequence. The double stranded copies are then cleaved and
CC reacted with either first or second adaptor sequences. The first and
CC second conjugate mixtures are then allowed to form dimers with each other
CC through the target sequences. The adaptor sequences are then removed to
CC leave target sequence dimers. These dimers are then polymerised to form
CC dimer multimers. The relative abundances of target identifiers in the
CC multimer allow expression levels to be determined. This method is useful
CC for developing polynucleotide abundance level profiles for cells and
CC tissues under various conditions, stages of development and disease
CC states, particularly where the target polynucleotide is present at low
CC levels. The method may also be used in the discovery and evaluation of
CC candidate therapeutic agents and their effective dosage levels. In
CC addition to the method described above, the invention also includes the
CC polynucleotide and polypeptide of P2. P2 is thought to be a member of a
CC novel chemokine family, denoted CX5C and may be associated with immune
CC function. Compositions of the P2 polypeptide may be useful in the
CC treatment of asthma, allergic rhinitis (hay fever), urticaria (hives),
CC anaphylactic shock and conditions involving immune system
CC hypersensitivity. The P2 polynucleotide to treat conditions using gene
CC therapy. The human P2 gene has been localised to chromosome 5, within the
CC cytokine gene cluster at 5q31. The present sequence is the reverse primer
CC P2 for target sequence human P2 gene

XX The sequence is that of a bovine microsatellite sequence obt'd. by
 CC screening a library of bovine MboI DNA fragments of between 250 and 500
 CC bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
 CC clones cross-hybridised. Assuming independent distribution of
 CC microsatellites and MboI sites, the frequency of (T₆)_n > 9 microsatellites
 CC in the bovine genome is estimated at >100, 000. The sequence information
 CC for ca. 230 such bovine microsatellites is summarised in the
 CC specification and indexed herein (see below). The sequences upstream and
 CC downstream of the microsatellite sequence were used to generate the
 CC required PCR primers for in vitro amplification of the corresp.
 CC microsatellite (using the program OPTIPRIM). The microsatellites may be
 CC used to identify individuals, for parentage testing, and in the genetic
 CC mapping of economic trait loci, or genes involved the determinism of
 CC economically important traits esp. in cattle, to allow selective
 CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
 CC field.)

XX Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
 PT using novel nucleic acid mols. as primers.

XX Disclosure; Col 9-10; 186pp; English.

XX The invention relates to the isolation of polymorphic repeat sequences
 CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
 CC markers. Primers based on these sequences can be used to detect these
 CC repeats, especially for use in e.g paternity or maternity testing, human
 CC genetic analysis such as linkage analysis of genetic disease, commercial
 CC animal or plant breeding or pedigree analysis. Clones containing the
 CC repeat sequences were isolated by hybridisation of chromosome-specific
 CC phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100
 CC repeat blocks were isolated. The inserts from the clones were amplified
 CC by primers AAT65798-T66047. Those clones where the repeat sequence has
 CC been determined are shown in AAT65704-797. This repeat sequence is from
 CC the marker clone Mfd32 which contains the repeat sequence having the
 CC formula: (AC)12A. (Updated on 25-MAR-2003 to correct PF field.)

 PT Depletion of transplantation antigens in donor cells - using anti-sense
 PT or triplex-forming oligonucleotide(s), used for treating auto-immune
 PT disease and in transplants.
 XX
 PS Example; Page 22; 71pp; English.
 XX
 CC The sequences given in AAQ47176-77 represent triplex forming oligo-
 CC nucleotides which bind to the mRNA sequence of the MHC class II locus DR
 CC A structural gene at positions 851-876. The sequences given in AAQ47178-
 CC 80 represent control oligomers which contain base compositions similar to
 CC that around this DR A region but not containing the correct sequences. DR
 CC A is a transplantation antigen. Binding of this sequence to the DR A gene
 CC inhibits antigen production. This method may be used for treating
 CC individuals with autoimmune disease, characterised by dysfunctional
 CC expression of a transplantation antigen. It may also be used to produce
 CC cells which are more easily transplanted into a recipient. (Updated on 25
 CC -MAR-2003 to correct PN field.)

XX Polymorphic bovine DNA markers - used in genetic identification, gene
 PT mapping, and selective breeding.

XX Table 7; Page 253; 517pp; English.

XX The sequence is that of a bovine microsatellite sequence obtd. by
 CC screening a library of bovine MboI DNA fragments of between 250 and 500
 CC bp with an (AC)₁₅ and a (TC)₁₅ oligonucleotide probe. One out of 50
 CC clones cross-hybridised. Assuming independent distribution of
 CC microsatellites and MboI sites, the frequency of (TC)₁₅ > 9 microsatellites
 CC in the bovine genome is estimated at >100, 000. The sequence information
 CC for ca. 230 such bovine microsatellites is summarised in the
 CC specification and indexed herein (see below). The sequences upstream and
 CC downstream of the microsatellite sequence were used to generate the
 CC required PCR primers for in vitro amplification of the corresp.
 CC microsatellite (using the program OPTIPRIM). The microsatellites may be
 CC used to identify individuals, for parentage testing, and in the genetic
 CC mapping of economic trait loci, or genes involved the determinism of
 CC economically important traits esp. in cattle, to allow selective
 CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
 CC field.)

 XX
 CC The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the
 CC construction of an oligonucleotide clamp. The clamp is a comb-type
 CC branched polymer which has 3' termini and was used to bind a target
 CC sequence comprising a segment of the HIV pol and nef genes in single
 CC stranded or double stranded forms. An oligonucleotide clamp is a compound
 CC capable of forming a covalently closed macromolecule or a stable circular
 CC complex after specifically binding to the target polynucleotide.
 CC Oligonucleotide clamps generally comprise one or more oligonucleotide
 CC moieties capable of specific binding to the target molecule and one or
 CC more pairs of binding moieties covalently linked to the oligonucleotide
 CC moieties. Upon annealing of the oligonucleotides moieties to the target
 CC polynucleotide, the binding moieties of a pair are brought into
 CC juxtaposition so that they form a stable covalent or non-covalent linkage
 CC or complex. The interaction of the binding moieties effectively clamps
 CC the specifically annealed oligonucleotide moieties to the target
 CC polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)

PT Obtaining a collagenous matrix with modified resistance against
PT proteolytic degradation, for treating a fibrotic condition, comprises
PT controlling the ratio of hydroxyallysine to allysine cross-links.
XX
XX Example 3; Page 12; 25pp; English.
XX
CC The invention relates to a method of obtaining a collagenous matrix which
CC comprises cross-linked collagen molecules, where the resistance of the
CC collagenous matrix against proteolytic degradation is controlled by
CC controlling the ratio of hydroxyallysine cross-links to allysine cross-
CC links in the collagenous matrix. The method is useful for obtaining a
CC collagenous matrix comprising cross-linked collagen molecules, where the
CC resistance of the collagenous matrix to proteolytic degradation, is
CC modulated. The method is useful for treating a fibrotic condition in a
CC mammal by administering to the mammal (preferably human) an effective
CC amount of a compound or composition which reduces the lysyl hydroxylation
CC level of collagen telopeptides and thereby results in a collagenous
CC matrix having a decreased ratio of hydroxyallysine cross-links to
CC allysine cross-links. The method comprises administration of compound or
CC composition that inhibits the activity or production of TLH encoded by a
CC PLOD2 gene but not the activity or production of lysyl oxidase. The
CC method is useful for treating fibrosis by inhibiting fibrotic processes,
CC in tissue engineering or drug delivery. The method provides collagen
CC cross-linked by hydroxyallysine cross-links which are more difficult to
CC degrade than collagen cross-linked by allysine. The present sequence
CC represents a PLOD2 PCR primer.

XX Detection of polymorphic genetic markers of the form (dC-dA)_n(dG-dT)_n -
 XX using novel nucleic acid mols. as primers.

XX Example 9; Col 61-62; 186pp; English.

XX The invention relates to the isolation of polymorphic repeat sequences
 CC having the sequence (dC-dA)_n(dG-dT)_n which can be used as genetic
 CC markers. Primers based on these sequences can be used to detect these
 CC repeats, especially for use in e.g paternity or maternity testing, human
 CC genetic analysis such as linkage analysis of genetic disease, commercial
 CC animal or plant breeding or pedigree analysis. The sequences AAT66084-
 CC T66107 represent repeat sequences of low informativeness found in
 CC specific human genes. This repeat sequence is found in the human
 CC chromosomal clone SW13. The sequence is amplified by primers AAT66106-7.

 XX PT Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups.
 XX PS Example 7; Col 19; 20pp; English.

XX CC The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonucleotide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylalkylamino bridges. The present sequence is an OC used in the present invention

 XX
 XX Typing genes that contain polymorphic microsatellite loci, useful for
 PT identifying predisposition to disease, by amplification and determining
 PT length of amplicons.
 XX
 XX Example 3; Page 30; 64pp; German.
 XX
 XX The invention describes a method of typing (M1) a gene (I) that has one
 CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
 CC amplification of at least one DNA region of (I) that includes PML, using
 CC as template a DNA sample containing at least one segment of (I); and
 CC determining the length of the resulting amplicon(s). Also described are:
 XX a method of determining (M2) microsatellite markers (MM) for
 CC predisposition to a disease, associated with a gene that includes one or
 CC more PML; and prediagnosis (M3) of diseases associated with gene that
 CC include PML. The method is used to identify microsatellite markers, in a
 CC disease-related gene, that are associated with a predisposition to
 CC diseases and for prediagnosis of such diseases, especially prion diseases
 CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
 CC metabolic diseases; also to type genes that encode milk proteins,
 CC hormones or transcription factors. The method is simpler, quicker and
 CC particularly less expensive than known methods based on sequencing. This
 CC sequence represents a primer used to genotype a region of the sheep prion
 CC protein (PrP) comprising a polymorphic microsatellite locus.

 XX
 XX Genetic testing for systemic lupus erythematosus in human, by amplifying
 PT nucleic acids from tissue sample to obtain amplification products, and
 PT detecting presence or absence of dinucleotide repeat sequence in
 PT amplification products.
 XX
 XX Claim 1; SEQ ID NO 6; 17pp; English.
 XX
 XX The invention relates to a genetic testing method for diagnosing systemic

CC lupus erythematosus (SLE) in human. The method involves amplifying
CC nucleic acids from human tissue samples and detecting the presence or
CC absence of variant alleles of a gene encoding poly(ADP-ribosyl)polymerase
CC (PARP), which is a diagnostic of SLE or indication of a genetic
CC predisposition for developing SLE. The method is useful for genetic
CC testing for SLE in a human subject. It is useful in genetic counselling
CC to provide useful information to persons considering their reproductive
CC options. The present sequence is human PARP DNA 85-bp allelic fragment.
CC This sequence is used to illustrate the method of the invention.

agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA sequence

XX
XX Oligo-nucleotide(s) for modulating effects of cytomegalovirus infections
PT - which can be hybridised with portion of RNA or DNA derived from IE1,
PT IE2 or DNA genes of cytomegalovirus.
XX
XX Disclosure; Table 2; 44pp; English.
XX
XX The oligonucleotide was synthesised to be complementary to a random
CC region of human cytomegalovirus. This site is known to control mRNA
CC stability, processing and/or translational efficiency. The synthetic
CC oligomer can hybridise to the native DNA polymerase of cytomegalovirus
CC and modulate the activity of CMV. The oligomer can be used
CC prophylactically or therapeutically to reduce the severity of disease
CC caused by CMV. It specifically inhibits replication of CMV by antisense
CC inhibition of gene expression. See also AAQ22353-400

DR	Oligo:nucleotide inhibiting capping of specific nascent mRNA - by steric	
XX	interference or chemical modification, are useful for treating diseases	
PT	and for regulating gene expression.	
PT	Example 2; Page 11; 29pp; English.	
XX	AAQ72765 describes the 5'end of ICAM-1 nascent mRNA, to which the	
CC	antisense oligonucleotides described in AAQ72766 and AAQ72767 are	
CC	complementary. These two complementary oligonucleotides are ICAM-1	
CC	nascent mRNA capping inhibitors, they work by preventing the binding of	
CC	the capping enzyme through steric interference, or chemical modification.	
CC	This inhibition interferes with ICAM-1's export from the nucleus, its	
CC	translation and its stability. The capping inhibitors can therefore be	
CC	used in the treatment of diseases and in the regulation of gene	
CC	expression in experimental systems. (Updated on 25-MAR-2003 to correct PN	
CC	field.)

PS Example 5: Page 50: 101pp: English:

Antisense oligonucleotides which target human ICAM-1 were synthesised in both the phosphodiester and phosphorothioate forms. Some of the oligonucleotides are useful to treat diseases which are modulated by changes in intercellular adhesion molecules. This sequence corresponds to nucleotides 111-130 of the coding region of the human ICAM-1 coding sequence and is not one of the preferred antisense oligonucleotides. (Updated on 25-MAR-2003 to correctPN field.)

XX New peptide nucleic acid oligomers hybridising to adhesion molecule genes
XX - are stable anti-sense cpds. of high affinity, partic. for treating
XX inflammation, viral infection, cancer etc.

XX Claim 2; Page 35; 57pp; English.

XX New oligomers are claimed which (A) have at least one peptide nucleic
XX acid (PNA) subunit and (B) have a sequence hybridisable to AUG region,
XX coding region, 5'-untranslated region or 3'-untranslated region of ICAM-1
XX or ELAM-1, or hybridisable to AUG region, coding region, 5'- untranslated
XX region, exon/intron junction region or 3'-untranslated region of VCAM-1.
XX The PNAs can be used to target RNA and single stranded DNA (ssDNA) to
XX produce antisense-type gene regulation moieties. Hence they may be used
XX therapeutically for modulating cellular adhesion and thus as
XX CC antimetastatic agents, anticancer agents, antirhinoviral agents, anti-
XX AIDS agents and antiinflammatory agents. They may also be useful as
XX CC diagnostics, e.g. as probes for specific mRNAs. PNA oligomers have high
XX CC affinity for complementary single stranded DNA. They are also able to
XX CC form triple helices in which a first PNA strand binds with RNA or ssDNA
XX CC and a second PNA strand binds with the resulting double helix or with the
XX CC first PNA strand. The PNAs possess no significant charge and are water
XX CC soluble, which facilitates cellular uptake. Further, since they contain
XX CC amides of non-biological amino acids, they are biostable and resistant to
XX CC enzymatic degradation by proteases. The present sequence targets human
XX CC intercellular adhesion molecule-1 (ICAM-1) 3' untranslated region

 XX PT
 XX PS Claim 1; Page 31; 36pp; German.
 XX CC The antisense oligonucleotide (ON) shown is a derivative of an equivalent
 CC wild type Human ICAM ON, in which at least one, esp. 2-10, non-terminal
 CC pyrimidine nucleotide(s) is/are modified. The modification may be: (a)
 CC replacement of a phosphodiester linkage by: a phosphorothioate (PS), -
 CC dithioate, -aramidate, borano-, alkyl-, aralkyl-phosphate; 2,2,2-
 CC trichloro-1,1dimethyl-, alkyl- or aryl-, aralkyl-phosphate; 2,2,2-
 CC thioformacetal, methylhydroxylamine, oxime, methylenedimethylhydrazo,
 CC dimethylene sulphone or silyl linkage; (b) replacement of a sugar
 CC phosphate backbone by a 'morpholinonucleoside' oligomer; (c) replacement
 CC of beta-D-2-deoxyribose by another sugar or carbocyclic, open-chain or
 CC bicyclic sugar analogue; or (d) replacement of the natural nucleoside
 CC base by an analogue, e.g. 5-hydroxymethyl-uridine. The 5' and/or 3'
 CC terminus may also be modified with a lipophilic gp., eg. a farnesyl. The
 CC modifications increase nuclease resistance and thus improve stability and
 CC activity

XX New phosphono-mono:ester oligo:nucleotide analogues - inhibitors of gene
 PT expression for treating viral infections, cancer, restenosis, etc.

XX PS Disclosure; Page 42; 129pp; English.

XX This sequence represents an inhibitor of ICAM, and is an example of an
 CC oligonucleotide analogue of the invention. The oligonucleotide analogues
 CC of the invention are used as inhibitors of gene expression (antisense
 CC oligonucleotides, ribozymes, sense oligonucleotides and triplex-forming
 CC oligonucleotides), as probes for the detection of nucleic acids, and as
 CC auxiliaries in molecular biology. As gene expression inhibitors they may
 CC be used for treating viral infections (especially where the virus is HSV-
 CC 1, HSV-2, an influenza virus, VSV, hepatitis B or papilloma virus),
 CC cancer, restenosis, and medical conditions mediated by integrins or cell-cell
 CC adhesion receptors, and medical conditions induced by growth factors
 CC (especially TNF-alpha)

CC endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as E-
CC selectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence
CC targets the a fragment of the coding region (nucleotides 351-370) of ICAM
CC -1. ICAM-1, ELAM-1, and VCAM-1 represent three of the five cell adhesion
CC molecules involved in the adherence of white blood cells to vascular
CC endothelium. These sequences can be used in a composition for treating
CC allograft rejection. The composition contains one of these sequences in
CC combination with an immunosuppressive agent. The immunosuppressive agent
CC used in the compositions is breguinar, rapamycin, anti-lymphocyte serum,
CC a monoclonal antibody against LFA-1 or an antisense oligonucleotide. The
CC compositions can be used for treating or preventing allograft rejection,
CC such as cardiac or renal allograft rejection. By using these
CC compositions, allograft survival times are extended, and donor-specific
CC transplant tolerance is induced

 CC oligonucleotides of the invention. These sequences target regions of the
 CC coding sequences for human intercellular adhesion molecule-1 (ICAM-1),
 CC endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as E-
 CC selectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence
 CC targets the 5' CAP region (nucleotides 32-51) of ICAM-1. ICAM-1, ELAM-1,
 CC and VCAM-1 represent three of the five cell adhesion molecules involved
 CC in the adherence of white blood cells to vascular endothelium. These
 CC sequences can be used in a composition for treating allograft rejection.

CC The composition contains one of these sequences in combination with an
 CC immunosuppressive agent. The immunosuppressive agent used in the
 CC compositions is brequinar, rapamycin, anti-lymphocyte serum, a monoclonal
 CC antibody against LFA-1 or an antisense oligonucleotide. The compositions
 CC can be used for treating or preventing allograft rejection, such as
 CC cardiac or renal allograft rejection. By using these compositions,
 CC allograft survival times are extended, and donor-specific transplant
 CC tolerance is induced

XX New oligo:nucleotide analogues contg. phospho:mono:ester bridges - for
 PT therapeutic inhibition of gene expression, e.g. in cancer or viral
 PT infection, with good specificity and in vivo stability.

XX Disclosure; Page 23; 36pp; German.

XX This invention describes novel phosphonomonoester oligonucleotide
 CC analogues which act as inhibitors of gene expression (as sense/antisense,
 CC ribozyme or triplex-forming molecules), useful as diagnostic agents (i.e.

CC probes for detecting nucleic acid) or for treatment of diseases caused by
 CC viruses, influenced by integrins or cell-cell adhesion receptors, induced
 CC by factors such as TNF-alpha, or cancer or restenosis. The products of
 CC the invention satisfy the requirements of good in-vivo stability; ability
 CC to cross cellular and nuclear membranes, and specific binding to target
 CC nucleic acid better than known oligonucleotides

XX This invention describes novel phosphonomonoester oligonucleotide
 CC analogues which act as inhibitors of gene expression (as sense/antisense,
 CC ribozyme or triplex-forming molecules), useful as diagnostic agents (i.e.
 CC probes for detecting nucleic acid) or for treatment of diseases caused by
 CC viruses, influenced by integrins or cell-cell adhesion receptors, induced
 CC by factors such as TNF-alpha, or cancer or restenosis. The products of
 CC the invention satisfy the requirements of good in-vivo stability; ability
 CC to cross cellular and nuclear membranes, and specific binding to target
 CC nucleic acid better than known oligonucleotides

 PT formation of more stable complexes with target nucleic acid.
 XX
 XX Example 11; Col 19; 18pp; English.
 XX
 CC AAT51073-T51079 represent inhibitors of the invention. This sequence
 CC specifically inhibits the intercellular adhesion molecule (ICAM-1). 75-
 CC 100 % of the nucleotides in these sequences are preferably joined by
 CC either Sp or Rp phosphorothioate 3' to 5' links. To create these
 CC sequences, 2'-deoxyribonucleoside-5'-O-(1-thiophosphate) (dNTPalphas) is
 CC prepared as a racemic mixture, and the pure Sp and Rp diastereomers are
 CC isolated (such as by reverse-phase HPLC on ODS Hypersil). The chiral
 CC products are then used to make these sequences enzymatically in the
 CC presence of a template, primer, and nuclease. Alternatively these
 CC sequences can be chemically synthesized. Oligonucleotides with chirally
 CC pure intersugar links form heteroduplexes with target RNA or DNA of
 CC greater thermodynamic stability (compared with racemic mixtures), and
 CC elicit RNaseH activity. Chirally pure oligonucleotides also have a better
 CC resistance to nuclease digestion. As these sequences inhibit HCV RNA
 CC transcription, they can be used as therapeutic, diagnostic, and research
 CC agents. More generally, chirally pure phosphorothioate oligonucleotides
 CC can be used as therapeutic agents in the same way as racemic (or non-
 CC sulphur substituted) compounds, such as to treat AIDS, inflammation,
 CC cytomegalovirus infection, and various cancers. (Updated on 25-MAR-2003
 CC to correct PF field.)

 XX Disclosure; Page 17; 57pp; English.
 XX
 XX This sequence represents a 2'-methoxy modified oligonucleotide. The
 CC invention relates to a method for inhibiting the translation of a capped
 CC target mRNA, which comprises contacting the capped target mRNA with an
 CC oligomer which: (1) is 8-25 bases in length; (2) is an oligonucleotide
 CC having a modified 2'-position, an oligonucleoside, or a peptide-nucleic
 CC acid; and (3) is specifically hybridisable with a 5' cap region of the
 CC target mRNA which includes at least one of the first 20 nucleotides at
 CC the 5' terminus of the target mRNA. The oligomer interferes with ribosome
 CC assembly on the mRNA. The method is particularly useful for inhibiting
 CC the translation of capped target mRNA encoding human ICAM-1, human E-
 CC selectin or a cytomegalovirus protein (preferably an IE1 or IE2 gene
 CC product). Elevated ICAM-1 levels are associated with rheumatoid
 CC arthritis, ulcerative colitis, Crohn's disease, psoriasis and renal
 CC transplant rejection. E-selectin (also known as endothelial leukocyte
 CC adhesion molecule-1, or ELAM-1) is involved in the adherence of white
 CC blood cells to vasculature endothelium and subsequent migration out of
 CC the vasculature. Antisense drugs targeted to cytomegalovirus IE2 mRNA may
 CC be effective against CMV retinitis in AIDS patients

CC Composition containing lipid-encapsulated therapeutic agent - useful, e.g. for delivering antisense molecules or ribozymes or treating diseases associated with aberrant gene expression.

XX

PS Example 4; Page 51; 98pp; English.

XX

CC The present sequence represents an antisense oligonucleotide directed against human intracellular adhesion molecule-1 (ICAM-1). The oligonucleotide can have either phosphorothioate or phosphodiester bonds. The oligonucleotide is lipid-encapsulated using the method of the invention. A composition comprising lipid-encapsulated particles of a therapeutic agent, e.g. antisense oligonucleotides, is prepared by mixing at least 2 lipids with buffered aqueous solution of charged therapeutic agent to form an intermediate mixture of lipid-encapsulated particles, and changing the pH of the mixture to neutralise at least some of the external surface charges on the particles. One lipid has a (de)protonatable group with Ka such that the lipid is charged at a first pH but neutral at a second pH (particularly near physiological pH) and the buffer maintains this lipid in the charged form (i.e. cationic when the therapeutic agent is anionic in the buffer, or vice versa). The second lipid prevents particle aggregation during formation of the lipid-therapeutic agent particles. The composition is used to introduce therapeutic agents into cells, in vivo or in vitro, particularly to treat or prevent diseases associated with aberrant gene expression in mammals, specifically tumours, inflammation or infection

Preparation of Phosphorothioate oligonucleotides applicable throughout
nucleic acid chemistry.
XX
XX
Example 3; Page 8; 17pp; English.
XX
XX
The present invention describes a method for preparing phosphorothioate
oligonucleotides by phosphorylating the 5'-hydroxyl of a nucleic acid
moiety in an acetonitrile containing solvent mixture to form a phosphite
intermediate (II) and oxidizing (II) with an acetyl disulfide in an
acetonitrile containing solvent mixture to effect conversion of the
intermediate to phosphorothioate (II). The present sequence represents a
phosphorothioate oligonucleotide from an example of the present
invention. The method can be used to sulphurise oligonucleotides of 8-50
nucleotides. The method is widely applicable throughout nucleic acid
chemistry. The process allows formation of phosphorothioate linkages in
the oligonucleotides or derivatives, without the need for complex solvent
mixtures and repeated washing or solvent changes. The process uses a
simplified solvent system and produces oligonucleotides having
phosphorothioate groups with efficiency and improved yields

 PT Oligonucleotide synthesis using substituted benzyl phosphoramidite for
 PT reaction with synthon having free 5'-hydroxy.
 XX
 PS Example 11; Page 46; 72pp; English.
 XX
 CC This sequence represents a phosphorothioate oligonucleotide synthesised
 CC using the method of the invention. The method is for the preparation of
 CC oligonucleotides containing a substituted benzyl(thio)phosphite residue
 CC comprises reacting an (oligo)nucleotide with a 3' substituted
 CC benzyl(thio)phosphoramidite with an (oligo)nucleotide having a free 5'-
 CC hydroxy, with one of the reactants, optionally immobilised on a solid
 CC phase. The method is used to prepare oligonucleotides, or analogues, for
 CC use as probes, primers, linkers, adapters or gene fragments, for
 CC diagnostic or therapeutic use, or as research reagents. The specified
 CC substituted benzyl group can be eliminated without release of toxic
 CC acrylonitrile (contrast conventional 2-cyanoethoxy protecting groups)

XX Composition comprising nucleic acid and penetration enhancer - used
 PT particularly for delivering therapeutic antisense oligonucleotides across
 PT the gastrointestinal mucosa, provides high bioavailability.

XX Example 2; Page 77; 115pp; English.

XX A pharmaceutical composition has been developed which comprises a nucleic
 CC acid and at least one penetration enhancer. The compositions are used:
 CC (i) to treat or prevent any disease or disorder that can be treated with
 CC the nucleic acid, e.g. cancer, Alzheimer's disease, beta-thalassemia,
 CC malaria, viral infections (including human immune deficiency virus
 CC (HIV)), inflammation, in human or animal medicine; (ii) to investigate
 CC the role of a gene or gene product in non-human animals; and (iii) to
 CC modulate gene expression in cells, tissues or organs. The compositions
 CC provide bioavailability of at least 15, preferably 17-35%. The
 CC penetration enhancer improves: (i) transport of the nucleic acid across
 CC the mucosa of the alimentary canal and into cells; and (ii) increases
 CC stability of the nucleic acid. Oral administration avoids the
 CC complications and expense of intravenous or other methods of
 CC administration. AAX18669 to AAX18799 and AAX18801 represent antisense
 CC oligonucleotides which can be used as the nucleic acid in the method of
 CC the invention

XX
XX Modified antisense oligonucleotide with increased bioavailability after
XX oral delivery - has heteroatomic backbone modification or 2'-modified
XX sugar, useful for diagnosis and therapy, e.g. of tumours.
XX
XX Example 6; Page 27; 54pp; English.
XX
XX The present invention describes oligonucleotides having: (a) at least one
XX heteroatomic backbone modification or at least one 2'-sugar modification;
XX and (b) during or after administration to the alimentary canal, greater
XX bioavailability than the corresponding phosphorothioate
XX oligodeoxynucleotide. Also described are compositions containing the
XX oligonucleotides having at least one 2'-alkoxyalkoxy sugar modification
XX and at least one 5-methylcytidine (5MeC) residue. The oligonucleotides
XX are antisense oligonucleotides for modulating expression of target genes
XX for diagnostic or therapeutic purposes, e.g. in cases of tumours,
XX autoimmune disease and inflammation, including graft vs. host disease.
XX The specified modifications increase bioavailability from the digestive
XX tract, eliminating the need for intravenous or other routes of
XX administration. The present sequence represents an antisense
XX oligonucleotide which is used in example to examine the effect of 2'MOE
XX modifications with 5-methylcytidine modifications on in vivo
XX bioavailability

PT Generation of antisense oligonucleotides - by specifically targeting a
PT GGGA motif found in mRNA sequences.

XX Example 2; Page 37; 55pp; English.

XX Antisense oligonucleotides (ASO) for inhibiting a tumour necrosis factor-
CC alpha (TNF-alpha) gene in an animal, preferably a human, comprise 12-50
CC nucleotides, 90% of which are complementary to a region of mRNA
CC containing a GGGA sequence motif. The ASO is used to inhibit expression
CC of a gene in an animal and for treating the animal when afflicted with a
CC disease or disorder characterised by the presence of an mRNA from a gene
CC containing a GGGA motif. The ASO are specifically targeted to a GGGA
CC sequence motif found in mRNA from a gene. A study of known ASO has shown
CC that at least half of the most efficacious ASO's contain one or more TCCC
CC motifs. This ASO comprises a TCCC motif followed by a cytosine residue
CC and corresponds to a region of the human ICAM-1 3' untranslated region

XX
XX New compositions comprising sensor arrays made up of unique probe
PT oligonucleotides - useful for characterizing a sample of target deletion
PT oligonucleotides.

XX Example 9; Page 100; 163pp; English.

XX This invention describes a novel composition comprising a number of
CC sensor arrays, where each array comprises a unique probe oligonucleotide,
CC which is the reverse complement of part of a unique target
CC oligonucleotide present in a mixture of target deletion sequence
CC oligonucleotides. The compositions form a method for characterizing a
CC sample of target deletion oligonucleotides which are labelled and
CC hybridize with the probe oligonucleotides of the sensor arrays. Such
CC oligonucleotides and their targets are represented in AAX23548-X23709.

CC Oligonucleotides characterized by the method form pharmaceutical
CC compositions that are useful for modulating cellular adhesion or
CC proliferation, and being active against a eukaryotic pathogen, a human
CC retrovirus, a human immunodeficiency virus (HIV), or a non-human
CC retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
CC Syncytial virus or cytomegalovirus (CMV). The compositions enable
CC characterization of deletion sequence oligonucleotides having related,
CC but different nucleobase sequences, and quantification of different
CC species of deletion sequence ("target") oligonucleotides in a mixture.
CC Also, if the specificity of the oligonucleotide's nucleobase sequence for
CC its reverse complement is not modified, the method may be performed using
CC oligodeoxynucleotides

PT New pro-cationic lipid compounds useful as components of liposomes used
PT as vehicles for delivering pharmaceutical agents into cells.
XX
PS Disclosure; Page 31; 65pp; English.

XX The present oligonucleotide is given in a specification disclosing a new
CC lipid compound and its salts, solvates and hydrates. The compound
CC comprises a hydrophobic tail part covalently linked to a hydrophilic head
CC part. A region proximal to the hydrophobic tail part has a net positive
CC charge at physiological pH and a region distal to the hydrophobic tail
CC part has a net negative charge at physiological pH. A disulphide bond
CC connects the regions. The lipid compound is useful for the construction
CC of liposomes used as vehicles for delivering pharmaceutical agents into
CC cells. The lipids and liposomes are fusogenic with membranes and deliver
CC pharmaceutical agents to tissues or cells without inherent aggregation,
CC which reduces toxicity

 PT Oligonucleotides containing segments of alternate phosphate and
 PT phosphorothioate internucleoside linkages, used in treating, e.g.
 PT inflammatory disorders.
 XX
 PS Example 3; Page 53; 77pp; English.
 XX
 CC The present sequence is that of oligonucleotide 15537. The
 CC oligonucleotide consists of 2'-modified nucleosides connected by
 CC phosphorothioate linkages. It is capable of modulating the activity of
 CC human ICAM-1, and hence may be useful as an antiinflammatory agent. The
 CC presence of phosphorothioate linkages provides resistance to nucleases.
 CC The invention relates to novel oligonucleotides that mimic and/or
 CC modulate the activity of wild-type nucleic acids. The oligonucleotides
 CC generally contain at least 1 region of 2'-modified nucleosides connected
 CC by alternating phosphodiester and phosphorothioate linkages (see also
 CC AAZ58227). They are antisense to a DNA or RNA segment and modulate the
 CC production and activity of a particular protein which may be undesired
 CC and lead to a disease

XX Oligonucleotide bioreversible phosphate esters used as, e.g. research
PT agents.

```

```

XX Example 5; Page 35; 61pp; English.
XX The present invention describes oligonucleotides containing bioreversible
XX phosphate ester groups and their mimetics. The oligonucleotides are of
XX value in therapeutics, diagnostics, and as research reagents. The
XX compound from the present invention may be used in control of hereditary,
XX metabolic, and/or cellular processes in any organism utilizing DNA-RNA
XX transcription and/or RNA-protein translation. These organisms include
XX prokaryotic and eukaryotic unicellular and multicellular organisms;
XX including bacteria, yeasts, protozoa, algae, and all plants and higher
XX animal forms, including warm blooded animals, particularly humans; also
XX organelle sub-cellular translation and transcription processes. The new
XX synthetic process provides pro-oligonucleotides, i.e., oligonucleotides
XX blocked at phosphate groups by bioreversible groups which can be cleaved
XX by intracellular and intercellular enzymes to generate an active
XX oligonucleotide, as for prodrugs and drugs. By careful selection of
XX protecting groups, deprotection of nucleobases and partial deprotection
XX of phosphate linkages can be achieved in the reaction sequence. Suggested
XX specific groups include S-pivaloylmercaptosethyl (SPME) and
XX cyanoethylcarbonyl (CEOC) groups. Spacer molecules include diglycolyl
XX (COCH22OCH22CO) and its analogue with a catechol biresidue replacing the
XX oxygen atom (1,2-phenylenedioxy-diacetic acid). The present sequence
XX represents a phosphorothioate oligonucleotide used in the exemplification
XX of the present invention

XX Determining predisposition of humans to develop autoimmune disease
PT involves detecting polymorphic microsatellite repeat sequence within
PT human costimulatory receptor gene locus.

```

XX PS Claim 18; Page 154; 160pp; English.

XX CC PCR primers AAA96409-10 were used to amplify polymorphic microsatellite repeat (PMR) sequences from the human costimulatory receptor gene locus (hCGR). The primers are used in the method of the invention. The CC CC specification describes a method for determining the predisposition of a human subject to develop autoimmune disease. The method comprises CC CC detecting a PMR sequence in the CD28, ICOS gene or CTLA4 gene of the CC CC length among individuals and can be amplified to generate products that CC CC differ in size. These products can then be detected by rapid and CC CC convenient high resolution processes. The method is useful for CC CC determining the predisposition of insulin-dependent diabetes mellitus (IDDM), Addison's disease, Graves disease, autoimmune hypothyroidism, CC CC myasthenia gravis, thymoma, lupus, thyroiditis, postpartum thyroiditis, CC CC rheumatoid arthritis, Hashimoto's disease, coeliac disease and leprosy. CC CC PMR sequences within hCGR are useful as markers in a variety of assays CC CC and in the field of forensic medicine, disease diagnosis and human genome CC CC mapping

XX PT Oligonucleotides having chiral R- and S- phosphorothioate internucleoside linkage regions, used as, e.g. antisense agents in therapy and diagnostics.

XX PS Example 32; Page 76; 116pp; English.

XX CC The invention relates to oligonucleotides having chiral R- and S- phosphorothioate internucleoside linkage regions, and their chiral intermediates. The oligonucleotides of the invention are particularly CC CC phosphorothioate nucleotides wherein the 5' and 3' terminal internucleoside linkages are chirally Sp and the internal internucleoside linkages are Rp. The oligonucleotides of the invention have increased CC CC stability relative to phosphodiester nucleotides as they are not CC CC recognised by extracellular and intracellular nucleases. The CC CC phosphorothioate nucleotides are of value as therapeutic, prophylactic and diagnostic agents, optionally as kits, for clinical disorders, and as CC CC research tools (e.g., for mutagenesis, or for forensic investigation). CC CC Oligonucleotides targetted against ICAM-1, VCAM-1, and ELAM-1 may be used in the treatment of inflammatory disorders such as psoriasis, lichen CC CC planus, contact dermatitis, and drug eruption. Those targetted against protein kinase C may be used to inhibit cell proliferation, tumorigenesis CC CC and metastasis. The oligonucleotides may also be of value in antiviral CC CC and antifungal applications e.g., for the treatment of HIV infection and Lyme disease. Sequences AAZ90212-290217 are oligonucleotides used in an CC CC exemplification of the present invention. They are respectively targetted CC CC against genes encoding human ICAM-1, human H-ras, human protein kinase alpha (PKC alpha), human C-ras, hepatitis C virus and murine ICAM-1

 XX Oligonucleotide for treating diseases associated with human tumor
 PT necrosis factor-alpha (TNF-alpha) such as, diabetes and rheumatoid
 PT arthritis, comprises nucleotide sequence complementary to intron of
 PT nucleic acid encoding TNF-alpha.
 XX
 XX Example 6; Page 56; 283pp; English.
 XX
 CC This sequence represents an antisense oligonucleotide sequence which
 CC targets a region of the human tumor necrosis factor alpha (TNFalpha)
 CC nucleotide sequence. TNFalpha is an important cytokine that plays a role
 CC in host defence. It is produced mainly in macrophages and monocytes in
 CC response to infection, invasion, injury or inflammation. Overexpression
 CC of TNFalpha can result in disease states, particularly in infectious,
 CC inflammatory and autoimmune diseases. The invention relates to antisense
 CC oligonucleotides, such as that represented by the present sequence which
 CC are capable of modulating the TNFalpha gene expression. The
 CC oligonucleotides optionally have a phosphorothioate backbone, and may
 CC also optionally contain at least one 2'-O-methoxyethyl modification. The
 CC oligonucleotides are useful for modulating the expression of human
 CC TNFalpha in cells and tissues, reducing a human cell inflammatory
 CC response, reducing the blood glucose level in a human and treating a
 CC human having a disease or condition associated with TNFalpha. Examples of
 CC diseases associated with TNFalpha include diabetes, inflammatory bowel
 CC disease, multiple sclerosis, pancreatitis, rheumatoid arthritis,
 CC infectious disease, hepatitis, atopic dermatitis or allograft rejection.
 CC The antisense oligonucleotides are also useful for modulating the
 CC function of a selected nucleic acid sequence in adipose tissue

 XX Method of preparing oligomeric compounds containing a phosphodiester or
 PT phosphorothioate linkage uses a mixture of ammonium hydroxide and a thiol
 PT in the deblocking step.
 XX
 PS Example 1; Page 27; 40pp; English.
 XX
 CC The present sequence is a synthetic 3'-P-O-allyl amidite derived
 CC oligonucleotide. This sequence was synthesised using the method of the
 CC present invention by which oligomeric compounds which have a
 CC phosphodiester or phosphorothioate backbone can be prepared. The method
 CC involves using either ammonium hydroxide and a thiol compound during a
 CC deblocking step of all or selected internucleoside linkages, or a
 CC mercapto compound in an aqueous amine followed by ammonium hydroxide

XX
XX Use of zinc finger peptides for cleaving nucleic acids, particularly
PT single stranded RNA, useful in diagnostic, therapeutic and research
PT applications.
XX
XX Example 17; Page 19; 38pp; English.
XX
XX The invention relates to a novel method of cleaving single-stranded RNAs
CC using a zinc finger peptide, such as that derived from the human male-
CC associated ZFY protein (AAI90588). Dimerisation of these peptides is
CC essential for ribonuclease activity; zinc finger peptides tend to
CC homodimerise when the concentration of zinc is reduced. The homodimerised
CC zinc finger peptides specifically cleave pyrimidines in single-stranded
CC RNAs, preferentially cleaving 5'-pyrimidine-A-3'. The peptides do not
CC cleave single-stranded DNA, double-stranded RNA and DNA or 2'-methoxy
CC modified sequences. In one embodiment of the invention, a nucleic acid of
CC preselected sequence is cleaved using a zinc finger protein which is
CC tethered to a nucleotide sequence selected to specifically hybridise to a
CC portion of the preselected nucleic acid. The use of such a targeting
CC moiety enables the preparation of zinc finger peptides with activity
CC against particular RNA sequence (e.g., an mRNA important in disease). The
CC zinc finger peptides can be used to cleave nucleic acids, particularly
CC single stranded RNA. They are useful as therapeutics, diagnostics and
CC research reagents. The destruction or disablement of RNA can be a useful
CC event in interfering with disease states. The ability to cleave single
CC stranded RNA, especially with respect to other nucleic acids and
CC selectively with respect to cleavage site makes these molecules useful
CC for research where such selective cleavage can readily be used to
CC advantage. Similarly, diagnosis of disease may be had through use of zinc
CC finger peptides to cleave RNA in a predictable fashion. The activity of
CC the zinc finger peptides are zinc concentration dependent. Since the zinc
CC concentration directly affects dimerisation and concomitant cleavage,
CC control (especially automated control) of zinc ion concentration can be
CC used to control the cleavage reactions. The tethering to a specificity
CC enhancing moiety can lead to highly specific cleavage of nucleic acids,
CC specific not only as to the site of cleavage, occurring at pyrimidines
CC and Pyr-A, but also as to molecular identity. Sequences AAAI4452-AAI4455
CC represent oligonucleotides used in exemplifications as targeting
CC moieties for the human male-associated ZFY protein zinc finger peptide
CC (AAI90588). The present sequence represents an ICAM-1 targeting

XX Novel antisense nucleic acids targeted to specific sequences within the
 PT ICAM-1 gene, useful for treating inflammation and metastasis.

XX PS Claim 1; Page 20; 28pp; German.

XX This invention describes novel antisense nucleic acids (I) targeted
 CC against a specific nucleic acid sequence within human ICAM-1. The
 CC products of the invention have cytostatic, anti-inflammatory,
 CC dermatological, antiviral, antirheumatic, antiarthritic,
 CC immunosuppressive, antipsoriatic, antiasthmatic, antitussive activity and
 CC can be used for antisense therapy; gene therapy. The antisense nucleic
 CC acids or vectors are used to inhibit or eliminate acute or chronic
 CC inflammatory diseases of humans, virus infection, metastasis,
 CC inflammation of the skin, mobilization of hematopoietic stem cells,
 CC coughs and all biological processes under the influence of ICAM-1,
 CC ulcerative colitis, rheumatoid arthritis, lupus erythematosus, organ
 CC rejection, graft-versus-host reaction after bone marrow transplantation,
 CC psoriasis, asthma and neurodermatitis. In particular, the antisense
 CC nucleic acids are used to treat acute or chronic inflammation of gum
 CC disease. The antisense nucleic acids regulate or suppress ICAM-1 gene
 CC expression. The antisense nucleic acids or vectors can be used to
 CC suppress immune reactions against gene therapy using viral or non-viral

CC vectors in mammals. The antisense nucleic acids may also be used in kits
 CC to diagnose ICAM-1 associated disturbances. AAA12063-A12092 and AAA12099
 CC represent the antisense oligonucleotides described in the method of the
 CC invention

 XX
 CC This invention describes novel antisense nucleic acids (I) targeted
 CC against a specific nucleic acid sequence within human ICAM-1. The
 CC products of the invention have cytostatic, anti-inflammatory,
 CC dermatological, antiviral, antirheumatic, antiarthritic,
 CC immunosuppressive, antipsoriatic, antiasthmatic, antitussive activity and
 CC can be used for antisense therapy; gene therapy. The antisense nucleic
 CC acids or vectors are used to inhibit or eliminate acute or chronic
 CC inflammatory diseases of humans, virus infection, metastasis,
 CC inflammation of the skin, mobilization of hematopoietic stem cells,

CC coughs and all biological process under the influence of ICAM-1,
 CC ulcerative colitis, rheumatoid arthritis, lupus erythematosus, organ
 CC rejection, graft-versus-host reaction after bone marrow transplantation,
 CC psoriasis, asthma and neurodermatitis. In particular, the antisense
 CC nucleic acids are used to treat acute or chronic inflammation of gum
 CC disease. The antisense nucleic acids regulate or suppress ICAM-1 gene
 CC expression. The antisense nucleic acids or vectors can be used to
 CC suppress immune reactions against gene therapy using viral or non-viral
 CC vectors in mammals. The antisense nucleic acids may also be used in kits
 CC to diagnose ICAM-1 associated disturbances. AAA12063-A12092 and AAA12099
 CC represent the antisense oligonucleotides described in the method of the
 CC invention

 XX Composition for pulmonary delivery useful for treating and diagnosing
 PT pulmonary diseases such as asthma, tuberculosis, etc.
 PT
 XX Claim 54; Page 33; 85pp; English.
 XX
 CC This sequence represents an antisense inhibitor of ICAM-1. The invention
 CC relates to a pharmaceutical composition (C) for pulmonary delivery of an
 CC oligonucleotide, comprising at least one oligonucleotide or its
 CC bioequivalent. (C) can be used to investigate the role of a gene or gene
 CC product in an animal other than human. (C) is also useful in a method of
 CC modulating the expression of a gene in an animal. (C) is useful in
 CC treating or diagnosing asthma, lung cancer, pulmonary fibrosis,
 CC rhinovirus, tuberculosis, bronchitis, pneumonia. The oligonucleotides are
 CC useful in determining the nature, function and potential relationships to
 CC body or disease status in animal of various genetic components of the
 CC body. (C) is useful for therapeutic, palliative or prophylactic treatment
 CC or to prevent the onset or recurrence of the diseases associated with
 CC pulmonary disorders. (C) is also useful in the treatment of diseases
 CC caused by viruses (such as respiratory syncytial virus, Hemophilus
 CC influenza, parainfluenza, etc.), obstructive lung disorders (such as
 CC pulmonary embolism or anaphylaxis), chronic obstructive pulmonary disease
 CC (COPD), emphysema, chronic bronchitis, bronchiectasis and cystic
 CC fibrosis. (C) administered through pulmonary delivery overcomes the
 CC complication and expenses associated with other routes of administration.
 CC Modified or substituted oligonucleotides have enhanced cellular uptake,
 CC target binding and increased stability in the presence of nucleases.
 CC Pulmonary administration of phosphodiester oligonucleotides lowers the
 CC level of nuclease activity in lung tissue to afford phosphodiester
 CC oligonucleotides longer lifetimes in lung tissue

 XX New pharmaceutical composition useful for pulmonary delivery of
 PT oligonucleotide for treating asthma, lung cancer and pulmonary fibrosis.
 PT
 XX Claim 62; Page 34; 90pp; English.
 XX
 CC The present invention describes a pharmaceutical composition for
 CC pulmonary delivery of an oligonucleotide comprising at least one
 CC oligonucleotide where the sugar moiety of at least one nucleoside unit of
 CC the oligonucleotide is not a 2'-deoxyribofuranosyl sugar moiety or at
 CC least one internucleotide linkage within the oligonucleotide is not a
 CC phosphodiester or a phosphothioate linkage. The composition is useful for
 CC treating an animal having or suspected of having a disease or a disorder
 CC that is treatable with one or more nucleic acids e.g. asthma, a cancer of
 CC the lung, pulmonary fibrosis, rhinovirus, tuberculosis, bronchitis or
 CC pneumonia and other lung disorders e.g. respiratory syncytial virus, H.
 CC influenza, parainfluenza, obstructive lung disorders e.g. pulmonary
 CC embolism or anaphylaxis, chronic obstructive pulmonary disease (COPD),
 CC emphysema, chronic bronchitis, bronchiectasis and cystic fibrosis. The
 CC oligonucleotides are also useful for determining the nature, function and
 CC potential relationships to body or disease states in animals or various
 CC genetic components of the body. Pulmonary administration of an antisense
 CC oligonucleotide bypasses the complications and expense associated with
 CC intravenous and other routes of administration providing enhanced
 CC delivery of the oligonucleotides. The modified oligonucleotides have
 CC enhanced cellular uptake, enhanced binding to target and increased
 CC stability in the presence of nucleases. The present sequence represents
 CC an antisense oligonucleotide used in the exemplification of the present
 CC invention

XX PT Preparation of an oligonucleotide incorporating 2-aminoadenosine, with
XX PT stronger hybridization to its target sequence and useful in diagnosis and
XX PT therapy.
XX XX
XX PS Example 23; Page 42; 48pp; English.
XX XX
XX CC The invention relates to a novel method for the preparation of
XX CC oligonucleotides incorporating 2-aminoadenosine. A halogenated adenosine
XX CC is incorporated into an oligonucleotide using standard synthesis methods,
XX CC which is then reacted with an amine to produce 2-aminoadenosine. The
XX CC incorporation of 2-aminoadenosine and similar moieties into
XX CC oligonucleotides in place of adenosine provides an additional site for
XX CC hydrogen bonding to uridine or thymidine. This modification has been
XX CC shown to increase the binding affinity of oligonucleotides to their
XX CC target RNA sequences and, to a lesser extent, DNA sequences.
XX CC Oligonucleotides incorporating 2-aminoadenosine are useful as probes and
XX CC primers (e.g., for diagnostic use), linkers, adapters, and as antisense
XX CC therapeutics. Oligonucleotides incorporating 2-aminoadenosine exhibit
XX CC stronger hybridisation with their target sequences. Sequences AAA10245-
XX CC AAA10252 represent 2-aminoadenosine-containing oligonucleotides
XX CC synthesised in an exemplification of the present invention

DR A method for delivering antisense oligonucleotides to cells using lipid
PT capsules comprising steric barrier lipids.
PT
XX
XX Example 4; Page 55; 99pp; English.
XX
XX This sequence represents an antisense oligonucleotide sequence which has
CC human intracellular adhesion molecule-1 (ICAM-1) as its target gene. The
CC oligonucleotide is used in a method for delivering lipid encapsulated
CC therapeutic agents (i.e. antisense oligonucleotides) to mammals. The lipid
CC capsule comprises steric barrier lipids that prevent particle aggregation
CC during lipid nucleic acid formation. The method may be used for the
CC delivery of therapeutic agents to mammalian cells. It is especially
CC suitable for delivering nucleic acid molecules, and in particular
CC antisense molecules which may be administered to down regulate the
CC expression of aberrant genes. The aberrant gene may be ICAM-1, c-myc, c-
CC myb, ras, raf, erb-B-2, PKC-alpha, IGF-1R, EGFR, VEGF and/or VEGF-R-1. The
CC method may be used for the treatment of tumours, inflammatory diseases
CC and/or infectious diseases

XX
XX New liposome compositions having long plasma half-lives, used for
PT delivering compounds for treating e.g. tumors, inflammation or autoimmune
PT diseases.
XX
XX Disclosure; Page 33; 91pp; English.
XX
XX The present invention describes a liposome (I) which has a plasma half-
CC life of at least 5 hours and comprises at most 10 mol % of a
CC phosphatidylglycerol (PG) compound that has a fatty acid portion of 10 to
CC 20 carbon atoms. The liposomes can be used to encapsulate a bioactive
CC agent, e.g. an anticancer agent, an anti-inflammatory agent, an
CC oligonucleotide (such as a hemimer, molecular decoy or an aptamer) or an
CC antisense compound (such as a ribozyme, an external guide sequence, a
CC compound comprising at most synthetic moiety which has nuclease activity,
CC an antisense peptide nucleic acid, an antisense nucleotide and/or
CC comprising a sequence that hybridises to a nucleotide sequence present in
CC a viral gene, ras gene or a gene encoding a cellular adhesion molecule).
CC Such liposomes can be used for: (1) preventing cancer or reducing the
CC rate of growth of a tumour or cancer in a mammal; (2) preventing or
CC reducing the severity of inflammation in a mammal (especially a human);
CC (3) modulating expression of a gene by contacting cells, tissues, organs
CC or organisms expressing the gene with the liposome; or (4) preventing,
CC reducing the rate of progression of or reducing the severity of symptoms
CC resulting from an autoimmune disease in a mammal. The liposomes have long
CC circulating half-life in mammalian plasma. AAZ48119 to AAZ48130 represent
CC antisense oligonucleotide sequences used in the exemplification of the
XX present invention

XX Aminoxy-modified nucleosides and oligonucleotides useful in diagnostic,
PT therapeutic and research reagents and for modulating the expression of
PT protein in organisms.

PS Example 84; Page 109; 195pp; English.

XX The invention relates to aminoxy-modified nucleosides and
CC oligonucleotides and to oligonucleotides that elicit RNase H for cleavage
CC in a complementary nucleic acid strand. It also relates to
CC oligonucleotides wherein at least some of the nucleotides are
CC functionalised to be nuclease resistant, at least some of the nucleotides
CC include a substituent that potentiates hybridisation of the
CC oligonucleotide to a complementary strand, and at least some of the
CC nucleotides include a 2'-deoxy-erythro-pentofuranosyl sugar moiety. The
CC inclusion of one or more aminoxy moieties in such oligonucleotides
CC provides for improved binding of such oligonucleotides to a complementary
CC strand. The oligonucleotides of the invention are used as diagnostic,
CC therapeutic or research reagents, and can be used to modulate gene
CC expression in organisms. The oligonucleotides containing the modified
CC nucleosides have increased nuclease resistance and increased binding
CC affinity to a complementary strand. The present sequence represents a
CC uniformly modified dimethylaminoxyethyl (DMAOE) antisense
CC oligonucleotide, targeted against the ICAM-1 gene, which was used in
XX exemplifications of the present invention

XX Cleaving a specific RNA comprising hybridizing the RNA with a chimeric
PT molecule consisting of antisense polyamide nucleic acid (pna) and RNase L
PT activator moieties, useful for treating e.g. cancer and inflammatory
PT diseases.

PS Disclosure; Page 12; 41pp; English.

XX The present sequence represents an antisense polyamide nucleic acid
CC (peptide nucleic acid (PNA)), which is covalently linked to a RNase L
CC activator moiety. The oligonucleotide is used in the method of the
CC invention. The specification describes a method of cleaving a specific
CC RNA, optionally contained within a cell. The method comprises hybridising
CC the RNA with a chimeric molecule of antisense PNA and RNase L activator
CC moieties, and reacting the resulting complex with RNase L. The chimeric
CC molecule is useful for treating Respiratory Syncytial Virus infection,
CC inhibiting tumour growth, treating viral infection (e.g. human
CC immunodeficiency virus (HIV)), autosomal dominant diseases caused by a
CC mutant gene, chronic myelogenous leukemias, and Crohns disease and other
CC inflammatory conditions. It is also useful for sequence-specific
CC inhibition of a targeted mRNA in order to effectively knock out the
CC associated gene as an aid to elucidating the function of the encoded
CC protein

PT Coupling of a phosphoramidite nucleoside to a solid support-bound
PT nucleoside, useful for the synthesis of oligonucleotides for use in
PT diagnostic, research or therapeutic applications.
XX
XX Example 5; Page 18; 30pp; English.

CC The invention relates to the use of acetonitrile having a water content
CC of 30-1250 ppm in the linking of a phosphoramidite nucleoside (PMN) to a
CC solid support-bound nucleoside, and to the use of this process in the
CC synthesis of oligonucleotides. The method is used for the coupling of a
CC phosphoramidite nucleoside to a solid support-bound nucleoside,
CC particularly in the large-scale synthesis of oligonucleotides using the
CC phosphoramidite method. The oligonucleotides can be used in diagnostic,
CC research and therapeutic applications, e.g., as probes, primers, linkers,
CC adaptors and antisense oligonucleotides. The use of acetonitrile having a
CC water content of 30-1250 ppm as compared to conventional methods using
CC lower water content acetonitrile (at most 30 ppm) provides more
CC economical synthesis without reduced efficiency of oligonucleotide
CC synthesis. Sequences AA14471-A14474 represent oligonucleotides
CC synthesised using the process of the invention

PT New antisense oligonucleotides, used for treating e.g. inflammatory
PT conditions, psoriasis, graft rejection, cancers, infections,
PT cardiovascular disorders or autoimmune disorders.
XX

PS Example 10; Page 178; 199pp; English.

CC This sequence is an antisense oligonucleotide of the invention. The
CC antisense oligonucleotides are targeted to a nucleic acid encoding a
CC cellular adhesion molecule (CAM) and is capable of modulating the
CC expression of the CAM. They particularly inhibit intercellular adhesion
CC molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), or
CC endothelial leukocyte adhesion molecule-1 (ELAM-1). The antisense
CC oligonucleotides can be used to modulate CAM activity in mediating
CC cell:cell interactions and subsequent cellular and biological responses,
CC e.g. T cell activation, leukocyte transmigration and inflammation. The
CC antisense sequences can be used for modulating the synthesis of a CAM.
CC They can be used for treating an animal suspected of having or being
CC prone to a disease or condition associated with a CAM. Oligonucleotides
CC targeted to ICAM-1 can be used for treating an inflammatory disease or
CC condition e.g. inflammatory bowel disease such as Crohn's disease,
CC colitis or ulcerative colitis, a condition of the skin, e.g. psoriasis or
CC cytotoxic dermatitis, rheumatoid arthritis, allograft rejection, cancer,
CC pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences
CC can also be used for reducing corticosteroid use in a patient or for
CC reducing cyclosporine use in a patient. The oligonucleotides can also be
CC used for detection and diagnosis. They can also be used for treating e.g.
CC hyperproliferative disorders, tumours, diapedesis, graft versus host
CC disease, arthritis, infections, autoimmune disorders, e.g. autoimmune
CC thyroid disorders, autoimmune forms of arthritis, multiple sclerosis,
CC some forms of juvenile diabetes mellitus, myasthenia gravis, pemphigus
CC vulgaris, systemic lupus erythematosus, cardiovascular disorders,
CC myocardial ischaemia/reperfusion injury, dilated cardiomyopathy, acute
CC myocarditis, ischaemic heart disease or stroke

 XX
 XX This sequence is an antisense oligonucleotide of the invention. The
 CC antisense oligonucleotides are targeted to a nucleic acid encoding a
 CC cellular adhesion molecule (CAM) and is capable of modulating the
 CC expression of the CAM. They particularly inhibit intercellular adhesion
 CC molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), or
 CC endothelial leukocyte adhesion molecule-1 (ELAM-1). The antisense
 CC oligonucleotides can be used to modulate CAM activity in mediating
 CC cell-cell interactions and subsequent cellular and biological responses,
 CC e.g. T cell activation, leukocyte transmigration and inflammation. The
 CC antisense sequences can be used for modulating the synthesis of a CAM.
 CC They can be used for treating an animal suspected of having or being
 CC prone to a disease or condition associated with a CAM. Oligonucleotides
 CC targeted to ICAM-1 can be used for treating an inflammatory disease or
 CC condition e.g. inflammatory bowel disease such as Crohn's disease,
 CC colitis or ulcerative colitis, a condition of the skin, e.g. psoriasis or
 CC cytotoxic dermatitis, rheumatoid arthritis, allograft rejection, cancer,
 CC pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences
 CC can also be used for reducing corticosteroid use in a patient or for
 CC reducing cyclosporine use in a patient. The oligonucleotides can also be
 CC used for detection and diagnosis. They can also be used for treating e.g.
 CC hyperproliferative disorders, tumours, diapedesis, graft versus host
 CC disease, arthritis, infections, autoimmune disorders, e.g. autoimmune
 CC thyroid disorders, autoimmune forms of arthritis, multiple sclerosis,
 CC some forms of juvenile diabetes mellitus, myasthenia gravis, pemphigus
 CC vulgaris, systemic lupus erythematosus, cardiovascular disorders,
 CC myocardial ischaemia/reperfusion injury, dilated cardiomyopathy, acute
 CC myocarditis, ischaemic heart disease or stroke

XX Preparation of nucleoside phosphoramidites and oligonucleotides.
XX
XX Example 42; Page 93; 153pp; English.
XX
XX The present invention describes nucleoside phosphoramidites and
CC oligonucleotides (ON's) prepared using pyridinium, imidazolium or
CC benzimidazolium salts as activators. The preparation of a phosphitylated
CC compound comprises reacting a compound having a hydroxyl group with a
CC phosphitylating reagent in the presence of a pyridinium salt in a
CC solvent. The phosphoramidites are useful as building blocks for synthesis
CC of oligonucleotides, which are potentially useful in therapeutic and
CC diagnostic applications. The activators can be produced in situ by mixing
CC pyridine and an acid, producing benefits in large scale synthesis.
CC Compared with conventional activators, e.g. 1H tetrazole, the pyridinium
CC salts, and materials necessary for their generation in situ, are non-
CC explosive and easier to store, and also cheaper and have higher
CC solubility in organic solvents. Final purity of the phosphitylated
CC material results from use of a less acidic reaction medium when
CC pyridinium salts are used. The present sequence represents a
CC phosphorothioate 20-mer oligonucleotide, the synthesis of which is
CC described in an example from the present invention

PT Preparation of mixed backbone oligomeric compounds useful as e.g. primers
PT for diagnostic tests, involves oxidation of H-phosphonate internucleoside
PT linkages to phosphodiester internucleoside linkages.
XX
PS Example 6; Page 34; 49pp; English.
XX
CC The present sequence is that of a phosphodiester oligonucleotide
CC containing T, C, A and G nucleobases, each having a 2'-methoxyethoxy
CC group on its 5' ribosyl sugar moiety, and prepared using 5'-O-DMT-2'-MOE-
CC 5-methylcytidine-3'-succinyl controlled pore glass as the solid support.
CC It is an example of an oligomeric compound produced according to the
CC methods of the invention. The invention provides compounds and methods
CC for the preparation of mixed backbone oligomeric, or chimeric, compounds
CC having phosphodiester internucleoside linkages in addition to
CC phosphorothioate and/or phosphoramidate internucleoside linkages. The
CC methods also include incorporation of boranophosphate internucleoside
CC linkages. The methods utilize H-phosphonate intermediates that are
CC coupled together forming contiguous regions of 1 or more H-phosphonate
CC internucleoside linkages. Each contiguous region is subsequently oxidized
CC to phosphodiester, phosphorothioate, phosphoramidate or boranophosphate
CC internucleoside linkages prior to further elongation. Mixed backbone
CC oligomeric compounds are prepared in this manner by oxidizing adjacent
CC regions with different reagents. Oligomeric compounds of the invention
CC are prepared using novel oxidation steps that oxidize a region of 1 or
CC more H-phosphonate internucleoside linkages without degrading existing
CC linkages that have been previously oxidized. The oligonucleotides
CC obtained are useful as primers in PCR, probes, linkers, gene fragments
CC and for other diagnostic tests on e.g. biological tissue, fluid, cells
CC etc., as research reagents, and as antiviral agents

XX Improving deprotection of acid labile 5'-hydroxy protecting group-
PT containing oligonucleotides for large scale synthesis of
PT oligonucleotides, involves determining the half life of protecting groups
PT in acid solution.
XX
XX Example 1; Page 14; 25pp; English.
XX
XX The present invention describes a method for improving deprotection of an
CC acid labile 5'-hydroxy protecting group-containing oligonucleotides (I).
CC The method involves determining the half life for (I) in an acid solution
CC capable of removing the 5'-hydroxy protecting group from oligonucleotide,
CC and reacting (I) in acid solution for approximately 5-20 half lives. The
CC method is useful for synthesizing and purifying oligonucleotides in large
CC scale. The method allows the user to determine an optical reaction time
CC for removal of the 5'-hydroxy protecting group so that a fine balance
CC between detritylation and depurination is maintained. The present
CC sequence represents a phosphorothioate antisense oligonucleotide targeted
CC to ICAM-1, which is used in an example from the present invention

XX The present invention relates to an oligonucleotide array comprising
XX oligonucleotide tags fixed to a solid substrate. The oligonucleotide
XX array is useful for genotyping a nucleic acid sample at one or more loci
XX via single base extension (SBE) reactions. A pair of primers is used to
XX amplify a polymorphic locus in a sample e.g. a single nucleotide
XX polymorphism (SNP). The present sequence is one of the primers used in
XX the method of the present invention to amplify a polymorphic sample. The
XX amplified nucleic acid product is then used as a template in a SBE
XX reaction with an extension primer. The SBE reaction products are used to
XX form the oligonucleotide array

 PT transport properties, useful as medicaments or diagnostic agents.
 XX
 XX Disclosure; Page 8; 28pp; German.
 XX
 XX This invention describes a novel conjugate (I) which consists of (A) a
 CC molecule to be transported and (B) at least one aryl residue of formula -
 CC Ar-(X-C(Y)-R₁)_n (II); Ar = group containing at least one aromatic ring;
 CC X = O or N (sic); Y = O, S or NH-R₂ (sic); R₁ = optionally substituted
 CC 1-23C alkyl (optionally containing double and/or triple bonds); R₂ =
 CC optionally substituted 1-18C alkyl (optionally containing double and/or
 CC triple bonds); n = integer of 1 or more. (A) is bonded to (B) directly or
 CC via a chemical group, provided that the chemical group is other than CH₂
 CC -S if the bond is via a phosphodiester linkage of (A). The invention also
 CC describes (i) the preparation of a conjugate (I') of (A') a molecule to
 CC be transported and (B') at least one aryl residue (not restricted to
 CC (II)), by preparing (A') containing a reactive function at the position
 CC at which (B') is to be bonded, preparing (B') and reacting (A') and (B');
 CC and (ii) the use of aryl groups (II) (optionally bonded via a chemical
 CC group) for transporting (A) across biological membranes. The products of
 CC the invention have cytostatic, virucide, vasotropic, dermatological,
 CC antipneumatic and antiasthmatic activity and can be used for gene
 CC therapy. Conjugation of (A) with (B) is useful for transporting (A)
 CC across biological membranes or into eukaryotic or prokaryotic cells
 CC (specifically bacterial, yeast or mammalian cells, including human cells,
 CC particularly tumor cells). Medicaments, diagnostic agents and test kits
 CC containing (I) are also claimed. Typically (I) are antisense
 CC oligonucleotide derivatives for tumor therapy; oligonucleotide drugs for
 CC treating viral infections or diseases associated with integrins or cell-
 CC cell interactions (e.g. restenosis, vitiligo, psoriasis or asthma); or
 CC labeled oligonucleotides for in vivo diagnostic use, e.g. by in situ
 CC hybridization. Conjugation with (B) markedly improves the cellular uptake
 CC of (A), e.g. in tumor cells. (B) include fluorescein derivative residues,
 CC in which case the conjugates (I) are fluorescently labeled, allowing
 CC microscopic monitoring of cellular uptake etc. The cellular uptake of (I)
 CC is superior to that obtained using other conjugated groups related to
 CC (II); e.g. oligonucleotides conjugated with fluorescein diacetate (within
 CC the scope of (B)) have superior uptake to corresponding fluorescein
 CC conjugates

 PT regions imparting nuclease resistance.
 XX
 XX Example 31; Page 75; 129pp; English.
 PS
 XX The invention relates to oligomeric compound comprising a plurality of
 CC covalently-bound nucleosides. The oligomeric compound has an internal
 CC region of Rp chiral phosphorothioate linked 2'-deoxynucleosides and two
 CC external regions flanking the internal region. The external regions
 CC impart nuclease resistance to the oligomeric compound. The oligomeric
 CC compounds are nuclease resistant gapped oligonucleotides (i.e. gapmers)
 CC useful for therapeutics, diagnostics and as research reagents. They mimic
 CC and/or modulate the activity of wild type DNA and RNA. They are useful
 CC for treating diseases in unicellular prokaryotic, eukaryotic or
 CC multicellular eukaryotic organisms. These include organisms that utilise
 CC DNA-RNA transcription or RNA-protein translation as part of their
 CC hereditary, metabolic or cellular control. Therapeutic or diagnostic
 CC oligomeric compounds are useful for treating bacteria, yeast, protozoa,
 CC algae, all plants and all higher animal forms, including warm-blooded
 CC animals and organelles such as mitochondria and chloroplasts. The
 CC oligomeric compound is also useful for treating psoriasis, inflammatory
 CC disorders of the skin (e.g. lichen planus, toxic epidermal necrolysis,
 CC erythema multiforme), allergic contact dermatitis, skin cancer including
 CC benign tumours (warts and moles), and malignant tumours such as basalcell
 CC carcinoma, squamous cell carcinoma, malignant melanoma, Paget's disease,
 CC Kaposi's sarcoma; infectious diseases of the skin caused by viral,
 CC bacterial or fungal agents; AIDS, atherosclerosis and for determining the
 CC nature, function and potential relationship of various genetic components
 CC of the body to disease or body states in animals. The present sequence is
 CC a phosphorothioate antisense oligonucleotide targetted to human ICAM-1

 XX

CC The present invention relates to oligonucleotides with at least one 2'-
 CC aminoadenosine nucleoside unit, at least one phosphorothioate
 CC internucleoside linkage, and at least one 5-substituted uridine or
 CC cytidine nucleoside unit. The oligonucleotides are useful in inhibiting
 CC expression of a gene and in treating a disease or condition associated
 CC with the expression of a gene in an animal by reducing immune
 CC stimulation. The oligonucleotides may also be used as probes, primers,
 CC linkers, adapters, gene fragments, research reagents, and in the
 CC preparation of biological molecules

 XX Modulating complement activation in a cell, tissue or a bodily fluid,
 PT useful for treating diseases associated with complement activation,
 PT comprises administering oligonucleotide containing phosphorothioate
 PT modifications.
 XX
 XX Disclosure; Col 29; 22pp; English.
 PS
 CC The sequence represents an oligonucleotide which is modified with a
 CC phosphorothioate backbone. The oligonucleotide is an example of an
 CC oligonucleotide of the invention which can modulate complement activation
 CC in a cell, tissue or bodily fluid by being administered in two
 CC independent concentrations, one which initiates complement activation and
 CC a second concentration which inhibits complement activation. The method
 CC of is useful for modulating complement activation and thus useful

CC therapeutically for the treatment of abnormal and/or undesirable
 CC conditions which can arise as a result of complement activation, such as
 CC inflammation, immune diseases or autoimmune diseases (e.g. myasthenia
 CC gravis, systemic lupus erythematosus, ischaemia-reperfusion states,
 CC transplant rejection, organ failure, adult respiratory distress syndrome,
 CC ARDS, Alzheimer's disease and other neurodegenerative disorders). The
 CC oligonucleotides are useful as diagnostic and research reagents, and in
 CC gene therapy. The oligonucleotides possess modifications that provide
 CC improved characteristics such as compound stability and cellular uptake,
 CC which makes it suitable for therapeutic and prophylactic purposes

 DR Preparation of oligomeric compounds, useful for inhibiting specific gene
 XX expression, comprises reaction between two tetrahydrofuran derivatives.
 PT Example 5; Page 38; 62pp; English.
 XX The invention relates to preparation of oligomeric compounds (e.g.
 CC synthetic oligonucleotides) comprising the reaction between two
 CC tetrahydrofuran derivatives. Oligonucleotides prepared by the method of
 CC the invention (e.g. those which are complementary to the mRNA of a target
 CC gene i.e. antisense molecules) can be used in diagnostics, therapeutics
 CC and as research reagents and kits. They can be used for treating diseases
 CC associated with a specific protein e.g. by specifically hybridising with
 CC a strand of nucleic acid coding for the undesirable proteins and can be
 CC used on unicellular prokaryotic and eukaryotic organisms and
 CC multicellular eukaryotic organisms. The oligomeric compounds can be used
 CC to treat e.g. AIDS (acquired immunodeficiency syndrome), in conjunction
 CC with AZT, or arteriosclerosis. The present sequence is a modified
 CC oligonucleotide prepared by the method of the invention

PT stimulators.
PT
XX Disclosure; Page 14; 23pp; English.
PS
XX The sequence represents an FITC (fluorescein isothiocyanate) labeled
CC oligonucleotide complementary to part of the mRNA encoding the
CC intracellular-adhesion molecule ICAM. The oligonucleotide is included in
CC a composition comprising a fusion protein of herpes virus VP22 protein
CC 159-301 (having the transport function) and a cell-cycle progression
CC regulator (or its DNA) e.g. BH3 or apoptotic proteins. The composition is
CC used to reduce the proliferation of cells. The method of making the VP22
CC containing compositions is used for reducing proliferation of hyper-
CC proliferating cells e.g., cancer cells, for manufacturing a medicament to
CC reduce or treat cell proliferation e.g., cancer cell proliferation. The

CC method is also used for reducing or treating cell proliferation, in
 CC tumour cells present in tumour cell mass, non-malignant cells e.g.,
 CC benign tumour cells such as genital warts, smooth muscle cells present in
 CC restenosis, proliferating skin cells e.g., skin cancer, psoriasis or
 CC eczema skin cells, or proliferating cells of scar tissue

XX Chimeric oligonucleotides that can serve as substrates for human RNase
PT H1, useful for enhancing the effectiveness of antisense gene therapies.
XX
XX Example; Page 135; 178pp; English.
XX
XX The present invention provides a number of DNA-RNA oligonucleotides which
CC can act as substrates for human RNase H1 (a type II RNase). The sequence
CC consists of two portions, one of which is capable of supporting cleavage
CC of a complementary target RNA and the other of which is incapable of
CC supporting such cleavage. These can be used to enhance the effectiveness
CC of antisense therapies. The present sequence is an RNase H substrate used
CC in the exemplification of the invention

XX
XX Purification of oligonucleotides, useful as therapeutic and diagnostic
XX agents, by treatment with amine reagents that convert a-basic impurities
XX to removable imines.
XX
XX Example 8; Page 57; 84pp; English.
XX
CC The present invention relates to a method for purification of an
CC oligonucleotide from a mixture containing at least one contaminant by
CC treating the mixture with an amino reagent that forms an imine bond to
CC amino reagent and separating the oligonucleotide from the imine-bonded
CC amino reagent. The method is especially used to purify oligonucleotide
CC from sequences containing a-basic sites. Oligonucleotide are useful as
CC antisense therapeutic reagents for specific inhibition of gene
CC expression, also as diagnostic probes and research reagents. The method
CC is suitable for large scale (many kg) production and purification of
CC oligonucleotide. The present sequence is phosphorothioate oligonucleotide
XX used in the exemplification of the invention

 PS
 XX This invention describes novel polyamide-oligonucleotide derivatives (I)
 CC and their physiologically acceptable salts of formula F(DNA)-Li) q(PNA-
 CC Li) x(DNA-Li) s(PNA) t) xP' where q, r, s, t = 0 or 1, with the sum of
 CC two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
 CC (such as DNA or RNA or their known derivatives); Li = covalent linkage
 CC between DNA and PNA, i.e. a bond or a residue containing at least one
 CC atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure
 CC containing at least one nucleobase different from thymine; and F, F' =
 CC end groups and/or are connected through a covalent bond. The products of
 CC the invention have anticancer, antiproliferative, antiviral, hepatotropic
 CC and vasotropic activity and can be used for the inhibition of gene
 CC expression by antisense, ribozyme, sense, or triple-helix methods, or by
 CC binding to proteins (aptamers). (I) are used for treating diseases caused
 CC by viruses (human immune deficiency, herpes simplex, influenza, vesicular
 CC stomatitis, hepatitis B or papilloma), or mediated by integrins or cell-
 CC cell adhesion reactions, for treating cancer, or for inhibiting
 CC restenosis, particularly as antisense reagents. They are also useful in
 CC heterogeneous or homogeneous assays, as primers or probes, particularly
 CC where the target is amplified before being detected by hybridization, for
 CC diagnosis of genetic, malignant or pathogen-related diseases. (I) retain
 CC the increased affinity for complementary strands and better stability in
 CC serum, associated with conventional peptide nucleic acids (PNA), but lack
 CC the disadvantages, i.e. have improved cellular uptake, do not aggregate
 CC in aqueous solution, and have reduced affinity for purification
 CC materials, reduced cytotoxicity, better sequence specificity. They are
 CC more active than either DNA or PNA oligomers. When used as probes, (I)
 CC show different responses to base-pair mismatches in the DNA and PNA
 CC segments, allowing better discrimination between pathogenic and non-
 CC pathogenic conditions such as the transition from proto-oncogene to
 CC oncogene, also, when used as primers, with the PNA segment at the 5'-end,
 CC they produce amplicons resistant to 5'-exonuclease, allowing this enzyme
 CC to be used to eliminate RNA or DNA primers. The DNA component allows
 CC additional reactions not possible with PNA alone, e.g. 3'-tailing and (I)
 CC may be incorporated into a gene. AAH49208-AAH49264 represent
 CC oligonucleotides used to illustrate the method of the invention

XX PT Identifying a nucleic acid having a sequence capable of targeting a gene
XX of interest, for identifying nucleic acids for gene therapy, comprises
XX using the Nearest-Neighbor Thermal Stability Program.
XX PS Example 1; Col 25-26; 43pp; English.
XX CC The present invention describes a method for the identification of a
XX nucleic acid having a sequence capable of targeting a gene of interest
XX comprises: (a) a first database having a list of stability values for
XX independent combinations of N(x); (b) a computing unit having a means for
XX inputting data comprising N(x); data list, defining a nucleic acid
XX sequence of interest to be targeted to provide a second database; and (c)
XX a program capable of processing the first and second database to N(x)
XX comparison, and a stability value of a nucleic acid sequence capable of
XX targeting the gene of interest. The method is useful for identifying a
XX nucleic acid having a sequence capable of targeting a gene of interest.
XX These nucleic acids are useful in gene therapy and disease treatment. The
XX method may be used to obtain thermodynamic parameters for 20 combinations
XX of nearest-neighbour base pairs of DNA:RNA hybrid sequences. The Nearest-
XX Neighbour Thermal Stability Program can process data for use in
XX calculating thermal melting temperatures for phosphorothioate DNA:RNA
XX hybrids. The program can be readily extended to predict the most stable
XX triplex-forming sequences, or antigene oligomers. The present sequence
XX represents an antisense DNA oligomer designated S-ASO targeted to the
XX human intracellular adhesion molecule 1 (ICAM-1), which is used in an
XX example from the present invention

 PT
 XX Example 6; Page 21; 31pp; English.
 PS
 XX The invention relates to the use of aggregates comprising VP22 (viral
 CC protein 22) protein (or a polypeptide with the transport function of
 CC VP22), and oligonucleotides or polynucleotides with a disaggregating
 CC agent e.g. Aluminium phthalocyanine (AT) (simultaneously or sequentially)
 CC to treat target cells by delivering molecules to the cells and/or
 CC preventing cell proliferation and/or killing cells. Also included are a
 CC method of treating target cells to deliver molecules to the cells and/or
 CC prevent their proliferation and/or kill them comprising: (a) exposing the
 CC cells to the aggregate composition cited above; and (b) exposing the
 CC cells to the disaggregating agent cited above; which can promote
 CC disaggregation of the aggregate composition in cells, where steps (a) and
 CC (b) are carried out simultaneously or sequentially. a product comprising
 CC the aggregate composition and the disaggregating agent, as combined
 CC preparation for administration of these components, either sequentially
 CC or together, a pharmaceutical comprising the aggregate composition and
 CC the disaggregating agent, in combination with a pharmaceutical excipient
 CC and a cell preparation obtainable by treating the target cells in vitro
 CC as cited in the method above. The aggregate composition and
 CC disaggregating agent are useful in the manufacture of a medicament for
 CC treating diseases or target cells, and/or preventing cell proliferation
 CC and/or killing cells. These compositions, product or pharmaceutical are
 CC useful in therapy, particularly for manufacturing medicaments for use in
 CC therapy, or as a medicament for delivering molecules to cells to prevent
 CC cell proliferation or kill cells. In particular, these may be used for
 CC treating psoriasis, eczema, skin cancer, restenosis and scarring. The
 CC present sequence is an oligonucleotide used to demonstrate the method of
 CC the invention

 XX Reducing in vivo toxicity of therapeutic oligonucleotide which forms
 PT multimeric aggregates, by treating oligonucleotide such that is converted
 PT to monomeric form, or formation of multimeric aggregates is prevented.
 XX
 XX Example 3; Page 17; 39pp; English.
 PS
 XX The invention discloses a method for reducing the in vivo toxicity of a
 CC therapeutic oligonucleotide which tends to form multimeric aggregates.
 CC The method comprises heat treating the therapeutic oligonucleotide, in
 CC multimeric aggregate form, in order to convert all of the therapeutic
 CC oligonucleotide to a monomeric form or to prevent the formation of
 CC multimeric aggregates. One example of oligonucleotides which undergo
 CC multimerisation are those which include a sequence of four G bases. Such
 CC oligonucleotides aggregate into a quadruplex. The method is useful for
 CC reducing the in vivo toxicity of a therapeutic oligonucleotide which
 CC tends to form multimeric aggregates and for preparing a therapeutic
 CC oligonucleotide composition which is useful for administering to a mammal
 CC in need of therapy. The therapeutic composition, in combination with
 CC cisplatin, is useful for treating disorders, particularly cancer of the
 CC head and neck, upper gastro-intestinal cancers, such as hepatocarcinoma,
 CC cancers of the lower or upper oesophagus and metastatic breast cancer.
 CC The method reduces the toxicity of the therapeutic oligonucleotides
 CC (stemming from interactions with blood proteins, complement activation
 CC and inhibition of coagulation) and thus allows the use of higher and more
 CC efficacious doses. Thus, the monomeric oligonucleotides increase the
 CC margin of safety. The sequence presented is the antisense
 CC oligonucleotide, INX-2302, which is directed against ICAM-1 mRNA

PS Disclosure; Page 87; 96pp; German.
 XX The present invention relates to peptide nucleic acid (PNA) derivatives.
 CC These can be used in the treatment of cancer, viral infections, vitiligo
 CC or other pigmentation disorders, and asthma. The present sequence is an
 CC oligonucleotide fragment of a PNA described in the exemplification of the
 CC invention

 XX Alkylation of alcohols, amines, or thiols, useful for preparing
 FT nucleosides that are precursors for preparation of oligomeric compounds
 FT beneficial as therapeutics, involves use of cyclic sulfate intermediates.
 XX Example 15; Col 34; 45pp; English.
 XX The present sequence is that of a human intercellular adhesion molecule 1
 CC targeted oligonucleotide containing a phosphodiester backbone and 2'-O-(2-
 CC -methyl-thioethyl) modifications. This was compared with an
 CC oligonucleotide with a phosphorothioate backbone (see ABA91945) and with
 CC an oligonucleotide with only partial 2'-O-alkylation (see ABA91948), for
 CC targeted reduction of ICAM-1 levels in HUVEC cells. The invention
 CC provides methods for the alkylation of alcohols, amines, thiols and their
 CC derivatives by cyclic sulfate intermediates. Methods for the alkylation
 CC of the 2', 3' or 5'-hydroxy position of nucleosides and their analogues
 CC with cyclic sulfates to form the 2', 3' or 5'-O-alkyl sulfate modified
 CC compounds are disclosed. Displacement of the 2', 3' or 5'-O-sulfate with
 CC a nucleophile provides 2', 3' or 5'-O-modified nucleosides and their
 CC analogues. The methods are especially useful for the preparation of 2'-O-
 CC alkyl nucleotides, nucleosides and nucleoside surrogates that are
 CC precursors for the preparation of oligomeric compounds useful as
 CC therapeutics, diagnostics and research reagents. 2'-O-modification
 CC generally increases hybridisation, while use of a phosphorothioate
 CC internucleoside linkage improves nuclease resistance

 PT New antisense oligonucleotide having nucleoside units which specifically
 PT binds mRNA encoding human protein kinase C isoform, useful for treating
 PT hyperproliferative and inflammatory diseases e.g. psoriasis, tumor and
 PT cancer.
 XX
 XX Example 19; Col 25; 77pp; English.
 XX
 PS The invention comprises antisense oligonucleotides designed to bind mRNA
 CC encoding a human protein kinase C (PKC) isoform (i.e. PKC-alpha, PKC-beta
 CC type I, PKC-beta type II, PKC-gamma, PKC-delta, PKC-epsilon, PKC-zeta,
 CC and PKC-eta). The antisense oligonucleotides of the invention are useful
 CC for modulating the expression of the PKC isoforms. The antisense
 CC oligonucleotides are useful for treating hyperproliferative conditions
 CC (e.g. tumour, glioblastoma, bladder cancer, breast cancer, colon cancer
 CC and lung cancer), and inflammatory conditions (e.g. psoriasis). The
 CC antisense oligonucleotides of the invention are also useful for detection
 CC and diagnosis of PKC expression. The present sequence represents a human
 CC PKC antisense oligonucleotide of the invention. NOTE: The present
 CC sequence contains a phosphorothioate backbone

XX
XX Preparation of molecules of interest on solid support material e.g.
PT oligonucleotides such as backbone modified oligonucleotides and labeled
PT oligonucleotides, involves reacting specific materials.
XX
XX Example 3; Page 26; 63pp; English.
XX
XX The present sequence is a phosphorothioate antisense 20-mer oligonucleotide of mixed base composition that was produced in tandem synthesis on glycerol-derivatised controlled pore glass beads. The invention relates to a process for producing multiple molecules of interest, especially oligonucleotides, on a solid support. The process is used to produce 2, 3, 4 or more molecules of interest (the same or different from one another) on a single support material. It is useful

CC for preparing backbone-modified oligonucleotides such as phosphorothioate, phosphorodithioate and methyl phosphonate analogues useful as oligotherapeutic agents, labeled oligonucleotides, sugar-modified oligonucleotides and oligonucleotide derivatives such as oligonucleotide-peptide conjugates. In an example from the invention, the present oligonucleotide was prepared in tandem using a reusable support. With a column containing 12.4 mg of support, used 5 times, product yield was 77,000 A260 units/g support, compared with 10,900 A260 units/g in a control column used once. In another example, levulinic acid was used as a temporary capping group during synthesis of this oligonucleotide

XX
XX Preparing peptide linked oligomeric compound useful for diagnostics, therapeutics and as research reagents and kits by employing equimolar amounts functionalized oligomeric compounds and peptide reagents.
XX
XX Example 13; Page 70; 124pp; English.
XX
XX This invention relates to a novel method for preparing peptide linked oligomeric compounds by deprotecting the hydroxyl groups of a compound derivatising support medium, reacting deprotected hydroxyl groups with a nucleoside to form a compound from which a capped compound is formed, oxidized and cleaved to form an oligomeric compound having a reactive sulfur moiety. The reactive sulphur moiety is reacted with peptide with functional group reactive with sulfur moiety, to form a peptide linked

CC oligomeric compound. The method of the invention is useful for preparing
 CC an oligomeric compound. The oligomeric compounds can be used in
 CC diagnostics, therapeutics and as research reagents and kits. They can
 CC also be used in pharmaceutical compositions by including a suitable
 CC diluent or carrier. The oligomeric compounds of the invention can further
 CC be used for treating organisms having a disease characterised by the
 CC undesired production of a protein. This method is suitable for large
 CC scale synthesis of oligomeric compounds, the methods provide improved
 CC synthetic schemes which avoid the problem of prior art. The synthetic
 CC methods employed equimolar amounts of functionalised oligomeric compounds
 CC and peptide reagents which has successfully resulted in large scale
 CC synthesis. This scaled up synthesis is significantly larger than any
 CC synthesis method described previously. The methods are highly economical.
 CC The present sequence represents a human ICAM-1 oligomeric
 CC phosphorothioate 2'-O-MOE gapmer oligonucleotide used in an example of
 CC the method of the invention

XX PT New oligomeric compounds containing e.g. phosphite, phosphodiester and
 PT phosphorothioate linkages, useful as oligonucleotides or analogs in
 PT diagnostics, therapeutics and as research agents.

XX PS Example 14; Page 20; 33pp; English.

XX CC The invention describes oligomeric compounds containing a moiety. The
 CC oligomeric compounds are useful e.g. as oligonucleotides or
 CC oligonucleotide analogues in diagnostics, therapeutics and as research
 CC agents. Oligonucleotides and their analogues have been used in molecular
 CC biology as probes, primers, linkers, adapters and gene fragments. They
 CC may also be useful as antisense agents for various disease states, e.g.
 CC antiviral agents, or as competitive inhibitors of transcription factors
 CC to modulate their action. Oligonucleotides and their analogues have also
 CC been used as direct and indirect regulators of protein, in diagnostic

CC hybridisation techniques, and as primers in PCR reactions. This sequence
 CC represents a synthetic polynucleotide created using the oligomeric
 CC compounds synthesis method described in the invention

XX PT New oligomeric compounds containing e.g. phosphite, phosphodiester and
 PT phosphorothioate linkages, useful as oligonucleotides or analogs in
 PT diagnostics, therapeutics and as research agents.

XX PS Example 10; Page 19; 33pp; English.

XX CC The invention describes oligomeric compounds containing a moiety. The
 CC oligomeric compounds are useful e.g. as oligonucleotides or
 CC oligonucleotide analogues in diagnostics, therapeutics and as research
 CC agents. Oligonucleotides and their analogues have been used in molecular
 CC biology as probes, primers, linkers, adapters and gene fragments. They
 CC may also be useful as antisense agents for various disease states, e.g.
 CC antiviral agents, or as competitive inhibitors of transcription factors
 CC to modulate their action. Oligonucleotides and their analogues have also
 CC been used as direct and indirect regulators of protein, in diagnostic
 CC hybridisation techniques, and as primers in PCR reactions. This sequence
 CC represents a synthetic polynucleotide created using the oligomeric
 CC compounds synthesis method described in the invention

FT XX Example 3; Col 28; 28pp; English.
FT PS
FT CC The invention relates to novel oligonucleotides containing at least one
FT region of 2'-modified nucleosides connected by alternating phosphodiester
FT and phosphorothioate linkages. The oligonucleotides are used for
FT inhibiting the production or activity of a protein in an organism. The
FT oligonucleotides can be used in diagnostics, therapeutics and as research
FT reagents and kits, for treating e.g. psoriasis and inflammatory disorders
FT of the skin (such as lichen planus, toxic epidermal necrolysis, erythema
FT multiform), skin cancer, and infectious disorders of the skin (bacterial,
FT viral or fungal). The compounds are resistant to nuclease degradation,
FT and have increased binding affinity relative to phosphorothioate
FT oligomers. The staggered phosphorothioate/phosphodiester linkages will
FT also modulate the protein binding to plasma proteins. The present
FT sequence represents one of 13 antisense oligonucleotides of the invention

XX Detecting or quantitating oligonucleotides in a bodily fluid or extract
XX useful for studying pharmacokinetic properties of oligonucleotides in
XX humans comprises contacting the fluid or extract with a single-strand
XX specific nuclease.
XX
XX Disclosure; Page 5; 48pp; English.
XX
XX The sequences given in ABA00064-67 are antisense oligonucleotides which
XX were detected using the method of the invention for detecting or
XX quantitating an oligonucleotide in a bodily fluid or extract. The method
XX comprises contacting the fluid or extract with a probe complementary to
XX the oligonucleotide, and with a single-strand specific nuclease under
XX conditions in which the probe which is not hybridized to the
XX oligonucleotide is degraded. The method is useful for detecting,
XX localizing and quantifying administered oligonucleotides in bodily fluids
XX and extracts taken from patients undergoing antisense oligonucleotide
XX therapy. The method is also useful for studying the pharmacokinetic
XX properties of oligonucleotides in animal models and in humans. The method
XX is highly sensitive through providing an increased detection of small
XX molecules when compared to traditional slab-gel electrophoresis

XX PT Composition useful for treatment of e.g. tumors comprises particles
XX PT comprising lipid portion and a charged therapeutic agent.
XX PS Example 4; Col 15-16; 48pp; English.
XX CC The invention relates to a composition useful for treatment of e.g.
XX CC tumours. The composition comprises lipid-therapeutic agent particles
XX CC comprising a lipid portion and a charged therapeutic agent which is
XX CC encapsulated in the lipid portion. The lipid portion comprises a first
XX CC lipid component selected from lipids containing a protonatable or
XX CC deprotonatable (preferably protonatable) group that has a pKa such that
XX CC the lipid is in charged form at a first pH and in neutral form at a
XX CC second pH. The pKa of lipid component is from 4-11. The first lipid
XX CC component is further selected such that the charged form is cationic when
XX CC the therapeutic agent is anionic and vice versa; the second lipid
XX CC component is selected from lipids that prevent particle aggregation
XX CC during lipid-therapeutic agent particles formation and which exchange out
XX CC the lipid particle at a rate greater than PKC-Cerc20; third lipid
XX CC component is a neutral lipid selected from distearylphosphatidylcholine
XX CC (DSPC), palmitoylcholine (DOPE) or SM (sphingomyelin) and a fourth lipid
XX CC component which is cholesterol. Compositions of the invention are used
XX CC for treatment or prevention of a disease caused by aberrant expression of
XX CC a gene preferably ICAM-1 (intracellular adhesion molecule-1), C-myc, C-
XX CC myb, ras, raf, erb-B-2, PKC-alpha (phosphokinase C-alpha), IGF-1R
XX CC (insulin growth factor 1-receptor), bcl-2, EGFR (epidermal growth factor
XX CC receptor), VEGF and VEGF-R-1 (vascular endothelial growth factor receptor
XX CC 1) in a mammal or by inflammations such as tumour or an infectious
XX CC disease. The present sequence is an antisense oligonucleotide targeted

XX Composition useful for treatment of e.g. tumors comprises particles
PT comprising lipid portion and a charged therapeutic agent.
PT
XX Example 5; Col 15-16; 48pp; English.
PS
XX The invention relates to a composition useful for treatment of e.g.
CC tumours. The composition comprises lipid-therapeutic agent particles
CC comprising a lipid portion and a charged therapeutic agent which is
CC encapsulated in the lipid portion. The lipid portion comprises a first
CC lipid component selected from lipids containing a protonatable or
CC deprotonatable (preferably protonatable) group that has a pKa such that
CC the lipid is in charged form at a first pH and in neutral form at a
CC second pH. The pKa of lipid component is from 4-11. The first lipid
CC component is further selected such that the charged form is cationic when
CC the therapeutic agent is anionic and vice versa; the second lipid
CC component is selected from lipids that prevent particle aggregation
CC during lipid-therapeutic agent particles formation and which exchange out
CC the lipid particle at a rate greater than PEG-CerC20; third lipid
CC component is a neutral lipid selected from distearoylphosphatidylcholine
CC (DSPC), palmitoyl-oleoyl phosphatidylcholine (POPC), 1,2-dioleoyl-sn-3-
CC phosphoethanolamine (DOPE) or SM (sphingomyelin) and a fourth lipid
CC component which is cholesterol. Compositions of the invention are used
CC for treatment or prevention of a disease caused by aberrant expression of
CC a gene preferably ICAM-1 (intracellular adhesion molecule-1), C-myc, c-
CC myb, ras, raf, erb-B-2, PKC-alpha (phosphokinase C-alpha), IGF-1R
CC (insulin growth factor 1-receptor), bcl-2, EGFR (epidermal growth factor
CC receptor), VEGF and VEGF-R-1 (vascular endothelial growth factor receptor
CC 1) in a mammal or by inflammations such as tumour or an infectious
CC disease. The present sequence is an antisense oligonucleotide targeted
CC to human ICAM-1 gene

XX
XX Disclosure; Page 28; 62pp; English.
XX
XX The present invention describes an oral pharmaceutical formulation (I)
CC for delivering a bioactive macromolecule to a mucosal surface. (I)
CC comprises a first population of carrier particles comprising drug and a
CC bioadhesive compound; and a second population of carrier particles
CC comprising a penetration enhancer. Also described is a method for
CC enhancing the mucosal absorption of the bioactive macromolecule in a
CC mammal (preferably a human) by mucosally administering (I). (I) has
CC antiulcer, antiinflammatory, antirheumatic, antiarthritic and cytostatic
CC activities. (I) can be used for delivering a bioactive macromolecule to
CC a mucosal surface. It is used for the oral delivery of a drug to an
CC animal encompassing a human as well as other mammals, reptiles, fish,
CC amphibians and birds. It is used to deliver drugs including peptides,
CC proteins, monoclonal antibodies their fragments, nucleic acids (DNA and
CC RNA), oligonucleotides, antisense oligonucleotides, and small molecules.
CC It can be used to examine the function of various proteins and genes in
CC an animal, including those that are essential to animal development. It
CC can be used for the treatment of animals that are known or suspected to
CC suffer from any disease treatable with the inventive composition, e.g.
CC ulcerative colitis, rheumatoid arthritis, Crohn's disease, inflammatory
CC bowel disease, or undue cellular proliferation (cancers and tumours). The
CC present sequence represents an exemplary oligonucleotide from the present
CC invention, which can be used to inhibit ICAM-1

PT Analyzing DNA or RNA targets, useful for determining nucleic acid in a
PT biological sample, comprises using probes marked by a cofactor for an
PT enzyme.
XX
PS Example 1; Page 15; 36pp; French.
XX
CC The specification describes a method of analysing DNA or RNA targets. The
CC method comprises contacting the targets with oligonucleotide probes
CC attached to an enzyme cofactor marker which is recognized less by the
CC enzyme when it is on a free oligonucleotide than when it is on a
CC hybridized oligonucleotide. The method is useful for analysing DNA or RNA
CC targets. The invention is used to determine the amount of a target
CC nucleic acid in a biological sample and the level of complementarity
CC between the probe and the target nucleic acid. The present sequence
CC represents an oligonucleotide probe attached to flavin, an enzyme
CC cofactor marker for flavin reductase. The probe, together with its
CC complement ABZ77540, was used to study the activity of flavin reductase

 XX New cells recombinantly altered to express an exogenous AK155 cytokine
 PT receptor, useful for identifying agents for treating AK155-mediated
 PT diseases, e.g. inflammation, angiogenesis or cancer.
 PT
 XX Example 2; Page 51; 100pp; English.
 PS
 XX The present invention relates to a cell recombinantly altered to express
 CC an exogenous AK155 cytokine receptor comprising alpha and beta subunits.
 CC The cytokine receptor, when expressed in Ba/F3 cells, binds to AK155 and
 CC stimulates binding of STAT3 to interferon (IFN) gamma-activated
 CC sequences. The cell is useful in expressing AK155 cytokine receptor which
 CC may be used for identifying therapeutic agents useful for treating AK155-
 CC mediated conditions or diseases, such as inflammation (e.g. Crohn's
 CC disease), autoimmune diseases (e.g. multiple sclerosis, rheumatoid
 CC arthritis, psoriasis, asthma, allergies, diabetes mellitus, Sjogren's
 CC syndrome), transplant rejection, angiogenesis, and cancer. The current
 CC sequence represents an ICAM-1 forward primer sequence

PT

```

PT steroid/reporter molecule, reporter enzyme or peptide.

PS Example 19; Page 16; 23pp; English.

XX The invention relates to a derivatised oligonucleotide comprising several
XX linked nucleosides having a functionalised nucleoside bearing a
CC substituent such as steroid/reporter molecule, non-aromatic lipophilic
CC molecule, reporter enzyme, peptide, protein, water/lipid soluble vitamin,
CC RNA cleaving complex, metal chelator, porphyrin, alkylator, hybrid photo-
CC nuclease/intercalator or aryl azide photo-crosslinking agent. The
CC oligonucleotide is useful for effecting cellular uptake of the
CC oligonucleotide by contacting an organism with the oligonucleotide. The
CC oligonucleotide is useful in research and diagnostic methods, for
CC assaying bodily states in animals, especially disease states, or for
CC treatment of diseases through modulation of the activity of DNA or RNA.
CC The oligonucleotide has improved transfer across cellular membranes and
CC uptake properties. The effect of conjugation of an oligonucleotide with
CC folic acid was determined by the inhibition of intercellular cell
CC adhesion molecule-1 (ICAM-1). The present sequence represents a
CC derivatised oligonucleotide oligomer

XX Improved mucosal adjuvant useful in the preparation of vaccine for
PT stimulating an immune response comprises a lipid-nucleic acid formulation
PT containing a nucleic acid component encapsulated by a lipid.

XX Disclosure; Page 20; 71pp; English.

XX The present sequence is that of oligodeoxynucleotide ODN #12 (PS-8997)
CC for human intracellular adhesion molecule 1. This is an example of an ODN
CC that can be used in lipid-nucleic acid (LNA) formulations of the
CC invention comprising a lipid component and a nucleic acid component. The

CC invention is based on the discovery that such LNA formulations associated
CC with a target antigen stimulate enhanced mucosal immune responses,
CC especially IgA production, directed to that target antigen in vivo as
CC compared to the target antigen alone or mixed with free or unencapsulated
CC forms of the ODN. Claimed improved mucosal vaccines comprise an LNA
CC formulation with at least one antigen, the LNA formulation comprising a
CC lipid component that encapsulates the nucleic acid component, with the
CC lipid and nucleic acid components acting synergistically to stimulate
CC antigen-specific IgG production in a mammal

XX
XX Preparation of peptide linked oligomeric compounds useful in diagnostics
XX involves reacting deprotected hydroxyl group with nucleoside having a
XX protected hydroxyl group and an activated phosphorus containing
XX substituent group.
XX
XX Example 14; Page 22; 45pp; English.
XX
XX The invention describes preparation of a peptide linked oligomeric
XX compound (I) involving reacting a deprotected hydroxyl group with a
XX nucleoside having a protected hydroxyl group and activated phosphorus
XX containing substituent group. (I) is useful in the preparation of peptide
XX linked oligomeric compounds useful in diagnostics, therapeutics and as
XX research reagents. They are useful in the treatment of diseases
XX characterised by the undesired production of a protein in organisms such
XX as bacteria, yeast, protozoa, algae, plants and animals including warm-
XX blooded animals. The method is applicable to a large-scale synthesis of
XX peptide-linked oligomeric compounds; is cost-effective and efficient. The
XX method reduces the cost of preparation of (I). The process provides (I)
XX without the problems of aggregation associated with electrostatic
XX interactions. The process provides (I) with an increase in efficiency and

CC provides an improved synthetic scheme avoiding the problems encountered
 CC during synthesis of cationic peptides e.g. problems generated by use of
 CC excess peptide reagents used. This sequence represents an oligonucleotide
 CC phosphorothioate 2'-O-MOE gapper based on human ICAM-1 used in the
 CC preparation of a peptide linker oligomeric compound

PT Stimulating bactericidal permeability increasing protein in subject's
 PT tissue for inhibiting or preventing infection or invasion by bacteria in
 PT a subject, by administering lipoxin or lipoxin analog.

XX

PS Example; Page 78; 161pp; English.

XX

CC The invention relates to stimulating bactericidal permeability increasing
 CC protein (BPI) in a subject's tissue. The method involves administering a
 CC therapeutically effective amount of lipoxin or a lipoxin analogue, such
 CC that the subject's tissue expresses increased levels of BPI to treat
 CC infection. The method is useful for stimulating BPI in a subject's
 CC tissue, preferably mucosal cells e.g. oral epithelial cells or intestinal
 CC cells, and thus for inhibiting or preventing infection or invasion by
 CC bacteria in a subject. The method is useful for treating sepsis and
 CC infectious diseases. Sequences ACC85089-90 represent PCR primers for
 CC amplifying the human ICAM-1 cDNA, used in a transcriptional analysis of
 CC human BPI

XX

PS Claim 128; Page 11; 42pp; English.

XX

CC The present invention describes a method for treating a disease by
 CC administering: (a) a therapeutic oligonucleotide (TON) or double-stranded
 CC RNA (dsRNA) that includes a reactive group (RG) that can react with a
 CC mobile protein (MP) to form a covalent conjugate of TON/dsRNA and MP; or
 CC (b) TON or dsRNA already conjugated to MP through a covalent bond. Also
 CC described: (1) TON of 15-30 bases that includes (i) a part that binds to
 CC target RNA or DNA and (ii) RG; (2) TON of 15-30 bases that includes a
 CC part that binds to target RNA or DNA and is conjugated to MP through a
 CC covalent link; (3) dsRNA that includes RG; and (4) dsRNA that is
 CC conjugated to MP through a covalent link. TON have cytostatic,
 CC immunosuppressive, virucide, anti-HIV, antibacterial and cardiant
 CC activities. The method is used to treat, or prevent, hyperproliferation
 CC (particularly cancers, solid or haematological, including prevention of
 CC metastatic spread); autoimmune diseases; viral or bacterial infections;
 CC endocrine, neural, cardiovascular, pulmonary or reproductive system
 CC disorders. Also where TON or dsRNA are labelled, they can be used for
 CC diagnosis and monitoring of therapy. When linked to a mobile protein,
 CC TON/dsRNA have better cell entry (via endocytosis or other parts of the
 CC mobile protein metabolic process) and longer therapeutic life, increased
 CC from hours to weeks (the result of increased resistance to nuclease),
 CC without loss of affinity for the target. In many cases immune response to
 CC TON/dsRNA is also reduced, as is non-specific binding to endogenous
 CC proteins. The present sequence represents a human intracellular adhesion

CC molecule 1 (ICAM-1) antisense oligonucleotide, which is a specifically
CC claimed TON from the present invention.

XX Inhibiting corneal allograft rejection, by contacting an allograft with a
PT formulation having an oligonucleotide targeted to intercellular adhesion
PT molecule-1, extracellular adhesion molecule-1 or vascular cell adhesion
PT molecule-1.
XX
XX Example 5; SEQ ID NO 7; 106pp; English.
XX
XX The invention relates to a method of inhibiting corneal allograft
CC rejection, by contacting the allograft with a topical formulation
CC comprising an antisense oligonucleotide targeted to intercellular
CC adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ELAM-1)
CC

CC or vascular cell adhesion molecule-1 (VCAM-1). The oligonucleotide is
CC useful for inhibiting corneal allograft rejection or for preserving a
CC corneal explant ex vivo, where the explant is human. This sequence
CC corresponds to one of the oligonucleotide of the invention.

 PT New phosphorothioate monoester modified oligomers useful for treating
 PT organism having a disease caused by undesired production of protein.
 XX
 PS Example 1; SEQ ID NO 1; 22pp; English.
 XX
 CC The invention relates to phosphorothioate monoester modified antisense
 CC oligomers (of formula detailed in the specification). Also included is
 CC modifying in vitro a nucleic acid involving contacting a test solution
 CC containing RNase H and the nucleic acid with the phosphorothioate
 CC monoester modified antisense oligomer. The phosphorothioate monoester
 CC modified antisense oligomer is used for treating an organism having a
 CC disease caused by undesired production of protein, for modifying in vitro
 CC a nucleic acid, for diagnostic and research purposes, for modulating the
 CC expression of protein in organisms, for the diagnosis, detection and
 CC treatment of other conditions responsive to oligonucleotide therapeutics,
 CC for identification or quantification of an RNA or DNA or for modulating
 CC the activity of an RNA or DNA molecule. The compound enhances the
 CC hybridization and RNase H activation in the organism compared to
 CC oligomeric compounds without the modification. The compound has increased
 CC nuclease resistance and binding affinity to a complementary strand of
 CC nucleic acid. The compound has maximum therapeutic effect and minimum
 CC side effects. The compound enhances the efficiency of antisense
 CC inhibition of gene expression. The present sequence is a phosphorothioate
 CC monoester modified antisense oligomer of the invention.

 PT Treating an inflammatory skin disorder such as psoriasis comprises
 PT topically applying an antisense compound targeted to the nucleic acid
 PT encoding human B7 protein.
 XX
 PS Example 1; SEQ ID NO 17; 8pp; English.
 XX
 CC The invention relates to a method of treating an inflammatory skin
 CC disorder in an individual by topically applying an antisense compound
 CC targeted to a nucleic acid molecule encoding a human B7 protein. The
 CC invention is for treating an inflammatory skin disorder in individual.
 CC The skin disorder is psoriasis, contact dermatitis, atopic dermatitis,
 CC seborrheic dermatitis, nummular dermatitis, generalised exfoliative
 CC dermatitis or eczema. The invention effectively modulates critical
 CC costimulatory molecules such as the B7 protein. The present sequence
 CC represents an ICAM-1 targeted oligonucleotide.

XX PT New pathogen vaccine having a lipid-nucleic acid formulation in

FT combination with at least one microbial antigen, useful for stimulating

PT enhanced responses against bacterial, viral and parasitic infections.

XX PS Disclosure; SEQ ID NO 11; 138pp; English.

XX CC The present sequence is that of ODN11 (PS-2302) for human intracellular

CC adhesion molecule-1. This is an immunostimulatory oligonucleotide that

CC can be used in lipid-nucleic acid (LNA) vaccines of the invention.

CC Claimed vaccines comprise an LNA formulation in combination with at least

CC one microbial antigen, such as hepatitis B virus surface antigen. The

CC lipid component of the LNA comprises at least one cationic lipid. The

CC oligonucleotide component of the LNA preferably comprises at least one

CC CpG dinucleotide, a methylated cytosine and a phosphorothioate backbone.

CC The vaccine is capable of stimulating Th1 type humoral and cellular

CC immune responses. An enhanced humoral response is demonstrated by a

CC strong early peak of interferon-gamma production observed within hours of

CC vaccine followed by a second stronger peak of interferon-gamma production

CC observed several days later, correlated with antibody isotype switching.

XX PT New pathogen vaccine having a lipid-nucleic acid formulation in

FT combination with at least one microbial antigen, useful for stimulating

PT enhanced responses against bacterial, viral and parasitic infections.

XX PS Disclosure; SEQ ID NO 12; 138pp; English.

XX CC The present sequence is that of ODN12 (PS-8997) for human intracellular

CC adhesion molecule-1. This is an immunostimulatory oligonucleotide that

CC can be used in lipid-nucleic acid (LNA) vaccines of the invention.

CC Claimed vaccines comprise an LNA formulation in combination with at least

CC one microbial antigen, such as hepatitis B virus surface antigen. The

CC lipid component of the LNA comprises at least one cationic lipid. The

CC oligonucleotide component of the LNA preferably comprises at least one

CC CpG dinucleotide, a methylated cytosine and a phosphorothioate backbone.

CC The vaccine is capable of stimulating Th1 type humoral and cellular

CC immune responses. An enhanced humoral response is demonstrated by a

CC strong early peak of interferon-gamma production observed within hours of

CC vaccine followed by a second stronger peak of interferon-gamma production

CC observed several days later, correlated with antibody isotype switching.

XX Use of cationic antimicrobial protein of Mr 57 kDa (CAP37), a CAP37
PT peptide, or a CAP37 peptide monocyte derivative for treating
PT bacterial keratitis, bacterial conjunctivitis, endophthalmitis, or
PT blebitis.
XX
XX Disclosure; SEQ ID NO 11; 31pp; English.
PS
XX The invention relates to treating an ocular condition in an eye of a
CC mammal comprising administering a cationic antimicrobial protein of Mw 57
CC kDa (CAP37), a CAP37 peptide, or a CAP37 peptide monocyte derivative
CC to the eye of the mammal. Also included are a bactericidal or
CC bacteriostatic contact lens (comprising a contact lens, and a coating
CC comprising a CAP37, a CAP37 peptide, or a monocyte derivative of a
CC CAP37 peptide disposed upon a surface of the contact lens), and a method
CC of storing a mammalian corneal transplant comprising providing a medium
CC comprising a bactericidal or bacteriostatic quantity of a CAP37, a CAP37
CC peptide, or a CAP37 peptide monocyte derivative and disposing the
CC mammalian corneal transplant in the medium. The method is useful for
CC treating an ocular condition is bacterial keratitis caused by Pseudomonas
CC aeruginosa or Staphylococcus aureus, bacterial conjunctivitis,
CC endophthalmitis, or blebitis. The method is particularly useful for
CC treating corneal ulcer or wound in an eye of a mammal, or for inhibiting
CC bacterial infection or contamination of or by a contact lens. CAP37 and
CC CAP37 peptides may also be used as a disinfectant for cleaning or
CC sterilisation of contact lenses, and as a storage solution for preventing
CC contact lenses from becoming contaminated with bacteria while in storage
CC cases. An experiment was performed to determine whether CAP37 induced
CC ICAM-1, VCAM-1, PECAM-1, E-selectin (and control Beta actin) mRNA. The
CC present sequence is a reverse transcriptase (RT)-PCR primer used in the
CC above assay.

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

 XX PT Pharmaceutical composition for treating ailments associated with impaired
 PT respiration, has oligo(s) antisense to specific gene(s) or its
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
 PT ubiquinone.
 XX PS Disclosure; SEQ ID NO 13670; 872pp; English.
 XX CC The invention relates to a novel pharmaceutical composition, which has a
 CC first active agent comprising an oligonucleotide antisense to the
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
 CC junctions of genes encoding a polypeptide associated with lung and/or
 CC nasal airway dysfunction and a second active agent comprising an
 CC antiinflammatory steroid and ubiquinone. A composition of the invention
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
 CC immunosuppressive, and cytostatic activity. The composition may have a
 CC use in antisense gene therapy. The composition is useful for treating or
 CC preventing a respiratory, lung or malignant disease or condition, also
 CC for enhancing the prophylactic or therapeutic respiratory effect of an
 CC antiinflammatory steroid in a subject, for reducing or depleting levels
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
 CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX
PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 13768; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 13652; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 13805; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.

XX PS Disclosure; SEQ ID NO 13773; 872pp; English.

XX CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
XX Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
XX Disclosure; SEQ ID NO 13673; 872pp; English.
XX
XX The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytosatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antitense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX PS Disclosure; SEQ ID NO 13825; 872pp; English.
XX CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antitense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antitense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX KW Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX PS Disclosure; SEQ ID NO 13657; 872pp; English.
XX CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytotatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 13801; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
XX Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
XX Disclosure; SEQ ID NO 13795; 872pp; English.
XX
XX The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
